Evaluation of the effect of coenzyme Q10 in depression phase of bipolar disorder patients as adjuvant therapy

Protocol summary

Summary

The purpose of this study is evaluation of the effect of co-enzyme Q10 as adjuvant therapy in depression phase of bipolar disorder patients. This study is a double-blinded randomized study that is done on 74 patients with bipolar disorder depression. Patients are randomly divided into two groups of intervention and placebo. The intervention group receive 200 mg/day of co-enzyme Q10 for 8 weeks. The placebo group receive a placebo completely similar to drug in appearance for 8 weeks. The depression symptoms severity of patients is measured by Montgomery Asberg Depression Rating Scale(MADRS) in both groups (intervention and placebo) at the start of the study,4th week and 8th week of study and the effect of drug and placebo is evaluated based on MADRS.

Scientific title

Evaluation of the effect of coenzyme Q10 in depression phase of bipolar disorder patients as adjuvant therapy

Public title

The effect of Coenzyme Q10 in bipolar disorder

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: patients between 18-65 years old; patients with diagnosed bipolar depression based on DSM-5 and MADRS score equal to or more than 7
exclusion criteria: patients with anxiety disorder not related to bipolar disorder; patients with mixed episodes of depression and manic or hypomanic phase; patients with severe disease; patients who administrated antidepressant agents during 1 month ago; patients who administrated any antioxidant agents or supplements during 1 month ago; patients who did not administrated

drug or placebo regularly at least in 80% of study duration; pregnant patients; nursing patients

Age

From **18 years** old to **65 years** old
