Comparison of Adhesion molecules before and after of streptokinase infusion in patients with acute MI

Protocol summary

Summary

PCI is the only way which can reduce infarct size in heart muscle. The purpose of this study is to compare adhesion molecules before and after of streptokinase infusion in patients with acute MI. 40 patients with chest pain with diagnosis of acute MI who are candidates for receiving Streptokinase without history of hemorrhagic stroke, bland CVA in past year, brain neoplasm, active bleeding, aortic dissection, and pericarditis are included in the study. Intervention is Streptokinase infusion which infuses during 12 hours of chest pain and its side effects are bleeding and hypotension.

Scientific title

Comparison of Adhesion molecules before and after of streptokinase infusion in patients with acute MI

Public title

Comparison of Adhesion molecules before and after of streptokinase infusion in patients with acute MI

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: presence of acute MI referred to the emergency room and candidates of streptokinase infusion
Exclusion criteria: Contraindication of streptokinase, previous hemorrhagic stroke, bland CVA in the past year, brain neoplasm, active bleeding, aortic dissection or pericarditis

Age

From **20 years** old to **75 years** old

Gender

Both

Phase

Health conditions studied**1****Description of health condition studied**

Acute MI

ICD-10 code

I21.0

ICD-10 code description

Acute transmural myocardial infarction of anterior wall

Primary outcomes**1****Description**

Bleeding

Timepoint

Every 6 hours

Method of measurement

check of PT,PTT,INR

Secondary outcomes**1****Description**

Hypotension

Timepoint

Every 20 min

Method of measurement

cuff pressure

Intervention groups**1****Description**

streptokinase, 1.5 million IU, single dose IV infusion

Category

Treatment - Drugs
