

Clinical Trial Protocol

Iranian Registry of Clinical Trials

18 Sep 2026

The comparison of the effect of mother milk odor and non nutritive sucking on physiological and behavioral pain responses caused by hepatitis B vaccination in term infants.

Protocol summary

Summary

After birth, infants are exposed to numerous painful measures and there is a talent for getting to the negative effects of pain. To reduce pain, Use of non-pharmacological methods of pain control are effective. in this study, The effect of two non-pharmacological pain managements (Non-nutritive sucking and olfactory stimulation with mother milk) is compared. The population of the study, infants born in the ninth day hospital in Torbat heydariye receive the first dose of hepatitis B vaccine, will form with gestational age of 37 to 42 weeks and birth weight of 2500 to 3500 gram and The last time they did not receive pain medication. infants will be selected by convenience sampling. A total of 90 samples were randomly divided into three groups, two groups, the smell of breast milk odor and non nutritive sucking and a control group exposed. in the breast milk odor group, Olfactory stimulation is done from three minutes before to completion of the vaccination. in the non nutritive sucking group, soft and standard Pacifier will be used of three minutes before to completion of the vaccination. In the control group nothing will be done before and after vaccination. Pain physiological responses (heart rate, respiratory rate and oxygen saturation) will be recorded in two stages, before and after the intervention and pain behavioral responses is recorded using standard tools for assessing pain in infants (MBPS).

Health conditions studied

1

Description of health condition studied

pain

ICD-10 code

M79.6

ICD-10 code description

pain in limb

Primary outcomes

1

Description

heart rate, percent of oxygen saturation, breathing

Timepoint

Immediately before and after the intervention

Method of measurement

measuring heart rate In beats per minute, measuring oxygen saturation with use of pulse oximeter and respiratory rate in The number of movements of the chest in a minute

2

Description

pain behavioral responses

Timepoint

during vaccination

Method of measurement

infabt pain of assessment tool behavioral responses

Secondary outcomes

1

Description

Timepoint

Method of measurement

Intervention groups

1

Description

in the mother milk odor group, 2ml from the infant 's mother milk, has been prepared in the morning before the start of nutrition.poured on a gas is left at a distance of 3 cm from his nose. olfactory stimulation begins from 3 minuts before vaccination and continue to its completion.physiological responses are recored before and after the intervention and behavioral responses will be grade from the beginning to the end of the procedur.

Category

Prevention

2

Description

in the non nutritive sucking group, a kind of latex, soft and standard pacifier is used for each infant and with a soft pressure is kept in the mouth of the baby.This action

started from 3 minute before vaccination and will continue until its completion. .physiological responses are recored before and after the intervention and behavioral responses will be grade from the beginning to the end of the procedur.

Category

Treatment - Drugs

3

Description

In the control group, no intervention is done. Physiological responses is recorded before vaccination and after its completion and Behavioral responses, will be graded from the beginning to the end of the procedure.

Category

Treatment - Drugs
