A Comparison, between the analgesic effects of intravenous morphine sulfate with ketamine regimen, and intravenous morphine sulfate regimen solely, in management of the acute pain in renal colic patients who admitted to the emergency department of Imam Khomeini hospital of Sari in year 1394

Protocol summary

Summary

This double-blind clinical trial will be done to determine the effect of the combination of morphine and ketamine, in comparison with morphine alone in patients with acute renal colic pain. The inclusion criteria are VAS pain score between 7 and 10. Exclusion criteria a history of opium dependency and taking analgesics during last 6 ours prior to the visit. The study population will be included 200 patients with acute renal colic pain referred to Imam Khomeini Hospital. After getting informed consent from people, participants will be divided into two groups. In the first group, intravenous morphine and ketamine and the second group morphine and normal saline will be precipitated. The VAS pain score will be assessed zero, 20 and 40 minutes after the injection. The criteria for treatment response will be a pain score less than 4.

Health conditions studied

1

Description of health condition studied

Renal colic

ICD-10 code

N23

ICD-10 code description

Unspecified renal colic

Primary outcomes

1

Description

Pain

Timepoint

Zero, 20 and 40 minute after intervention

Method of measurement

Visual analogue scale

Secondary outcomes

1

Description

Respiratory rate

Timepoint

Zero, 20 and 40 minute after intervention

Method of measurement

Respiratory rate in minute

2

Description

Nausea

Timepoint

Zero, 20 and 40 minute after intervention

Method of measurement

Positive/negative

3

Description

Vomiting

Timepoint

Zero, 20 and 40 minute after intervention

Method of measurement

Positive/negative

4

Description

Vertigo

Timepoint

Zero, 20 and 40 minute after intervention

Method of measurement

Positive/ negative

5

Description

Blood pressure

Timepoint

Zero, 20 and 40 minute after intervention

Method of measurement

mmHg

6

Description

Rash or hives

Timepoint

Zero, 20 and 40 minute after intervention

Method of measurement

Positive/ negative

Intervention groups

1

Description

Morphine sulfate with 0.1 mg / kg the time of intervention and if necessary 0.05 mg / kg in 20 minute after intervention in both control and experimental groups

Category

Treatment - Drugs

2

Description

Ketamine 0.2 mg/kg before the time of intervention in experimental group

Category

Treatment - Drugs

3

Description

Placebo(normal saline) 5 ml at the time of intervention in control group

Category

Treatment - Drugs
