Comparison the effect of different Antrostomy and Sphenoidotomy size creation on postoperative mucosal edema and polyp growth rate in paranasal sinuses in patient with chronic rhinosinusitis and polyposis

Protocol summary

Summary

Objectives: Evaluation of Antrostomy and Sphenoidotomy size on polyposis recurrence and mucosal edema after surgery. **Design:** This study is a clinical trial among 210 20-50 year old patients with chronic rhinosinusitis and polyposis candidate for surgery. Patients are classified in 3 groups by another resident randomly through sortition. Surgeon will be informed about the type of intervention in operating room. We have 70 patients in each group. Three groups include: 1:Antrostomy less than 1 cm and sphenoidotomy less than 0.5 cm 2:Antrostomy 1-2 cm and sphenoidotomy 0.5 -1 cm 3:Antrostomy 2-3 cm and sphenoidotomy 1-1.5 cm. All surgeries will be done in Amir Aalam hospital by one surgeon. **Setting and Interventions:** Measurement of size between two device around ostium will be done by a ruler. Seven to ten days after group selection and surgery, mucosal lymphedema will be assessed and polyposis recurrence will be evaluated monthly in first 3 months and every 6 weeks in next three months (up to 6 months) using endoscope in clinic. Edema grading will be: (Grade 1:no lymph edema, Grade2:lymph edema without obstruction, Grade 3:lymph edema with obstruction) Recurrence grading will be: (Grade1:no polyp growth, Grade2:polyp growth without obstruction, Grade3: polyp growth with obstruction). **Inclusion criteria:** 20-50 year old patients with chronic rhinosinusitis and polyposis in more than 3 sinuses including maxilla and sphenoid that need surgery after all diagnostic and therapeutic processes. **Exclusion criteria:** limited disease, collagenvascular disease, allergy, asthma, ASA sensitivity, immune disorder, smoking and toxin exposure and patients without tendency to join to this study. **Primary outcome** is recurrence rate and edema and secondary outcome is further surgeries.

Scientific title

Comparison the effect of different Antrostomy and Sphenoidotomy size creation on postoperative mucosal edema and polyp growth rate in paranasal sinuses in patient with chronic rhinosinusitis and polyposis

Public title

Effect of sinuses ostium on post surgical outcomes.

Purpose

Prevention

Inclusion/Exclusion criteria

Inclusion criteria:20-50 years old patients with chronic rhinosinusitis with polyposis in more than 3 sinuses including maxilla and sphenoid that need surgery after all diagnostic and therapeutic processes. Exclusion criteria: limited disease; collagenvascular disease; allergy; asthma; ASA sensitivity; immune disorder; smoking and toxin exposure and patients without willingness to participate in research.

Age

From **20 years** old to **50 years** old

Gender

Both

Phase

Assignment

Parallel

Other design features

Patients are distributed in 3 groups like previously description.This is done randomly by third person that don't interfere in surgery.After choosing for surgery patients will refer to other room and are classified in 3 groups by another resident randomly and with balloting.Post operative endoscopy is done by second person that don't have any intervention in previous steps.
