### Comparison the effect of intravenous magnesium sulfate and intravenous ketorolac on pain of patients with renal colic

#### Protocol summary

##### Summary

Objective: Comparison the effect of intravenous magnesium sulfate and intravenous ketorolac on pain of patients with renal colic Design: Parallel single blind randomized clinical trial Randomization: Patients will allocate to two equal groups according to table of random numbers. Participants including major eligibility criteria: This study will conduct on 84 patients with renal colic affiliated to acute emergency department of Ahvaz Golestan hospital. Main inclusion criteria include diagnosis of renal colic with sonography; age of 18-55 years; having pain score of 5 based on visual analog score in admission time and main exclusion criteria include having history of heart, liver, kidney, metabolic diseases and seizures; systolic blood pressure below 90 mmHg; fever more than 37 degrees Celsius; pregnancy; abdominal pain and probable peritonitis; using calcium channel blockers. Main outcome: Pain severity Intervention: Patients in first group will receive ketorolac via intravenous with dosage of 30 mg in combination to 100 cc intravenous normal saline during 15 minutes. Patients in second group will receive 50 mg per kilogram intravenous magnesium sulfate 50% with total dosage of 100 cc during 15 minutes.
