Effect of reflexology on pain and sleep disorder in older women whit abdominal surgery

Protocol summary

Summary

The main objectives of the project: to determine the effect of reflexology (reflexology) on sleep disorders and pain in elderly women undergoing abdominal surgery study design: experimental clinical trial, non-random sampling, a control group and test centers. The study population consisted of older women undergoing abdominal surgery form. Inclusion criteria; exposure to abdominal surgery due to surgical incision and duration of surgery, the point 5 of the tool above the PSQI, no interference or foot deformity, no diabetes, grade 7 and older versions of Persian short test cognitive status, their ability to report pain. Exclusion criteria of the study; the lack of cooperation or death of the elderly, less than two days of hospital discharge after surgery, the risk of malignancy associated with any surgery, the patient needs to be hospitalized in the intensive care unit. A sample of 80 elderly women undergoing abdominal surgery case study is reflexology massage. Since Intervention: Intervention Reflexology in the morning (an hour after breakfast) and evening (one hour before bedtime) in the second and third day of surgery and for 20 minutes each will be conducted by the researcher. Primary Outcome: Reflexology intervention in reducing sleep disorders and pain affects older women undergoing abdominal surgery.
