Evaluation of the relationship between co2 insufflation rate during laparoscopic surgery and the shoulder pain after it, in patients undergoing laparoscopic cholecystectomy

Protocol summary

Summary

Objective: Evaluation of relation between co2 blowing speed during laparoscopy surgery and shoulder pain after surgery in patients with laparoscopic cholecystectomy in Kowsar hospital Study design: systematic random (toss); without placebo control; single central. The study population: patients with gallstone that will be undergoing laparoscopic cholecystectomy surgery. Inclusion criteria: all patients with gallstone that will be undergoing laparoscopic cholecystectomy surgery. Exclusion criteria: drug addiction; patients who receive sedation exception with shoulder pain; patients who need drains after surgery; patients who associated with bile leakage or bleeding during surgery; patients who have laparoscopic surgery become to open surgery. Sample size, intervention, intervention time, outcome of study: 100 patients with gallstones referred to operating room in Kowsar hospital that are candidate for laparoscopic cholecystectomy surgery and will be undergoing to surgery. Intervention group: in this group of 50 peoples, patients will be undergoing laparoscopic cholecystectomy surgery and then co2 gas injection will perform from start of laparoscopic surgery with high-speed (7.5 liters per minute) for them. Control group: in this group of 50 patients are undergoing laparoscopic cholecystectomy surgery and co2 gas injection will perform from start of laparoscopic surgery with low-speed (2.5 liters per minute) for them. The number of sedation request in 24 hours after surgery and also shoulder pain in 1, 6, 12 and 24 hours after surgery was checked with verbal rating scale method.
