Autologous melanocyte - keratinocyte suspension transplantation in patients with postburn leukoderma Comparison of two techniques to prepare the recipient site: Dermabrasion Versus Erbium: YAG laser

Protocol summary

Summary

Objectives: Autologous melanocyte - keratinocyte suspension transplantation in patients with postburn leukoderma Comparison of two techniques to prepare the recipient site: Dermabrasion Versus Erbium: YAG laser. Design: Randomized, Not blinded, Clinical trial. Setting and Conduct: In this study, patients were randomly divided into two groups A and B. Group A patients after skin biopsy as a donor site, in vitro melanocyte suspensions are prepared in accordance with patent procedures. The suspension obtained is transmitted to the desired area via dermabrasion technique. Group B patients receive suspension with Erbium YAG laser technique. From the third week UVA phototherapy is administered weekly for 3 months. Outcom measures will be assessed by the use of serial photography at baseline, one, three and six months after intervention. The study population: Post- burn leukoderma patients. Inclusion criteria: Age ≥ 18 years; without history of chronic diseases; The absence of coagulopathy; No evidence of hypertrophic burn scar; The total area treated is >40 cm². Exclusion criteria: Previous treatment of skin lesions; Active systemic infection. Intervention: One arm receives suspension via dermabrasion technique and the other receives suspension via Erbium YAG laser. Main Outcome Measures: Repigmentation scales assessed by dermatology Colleagues blinded to the randomization process and by means of serial photography.

Scientific title

Autologous melanocyte - keratinocyte suspension transplantation in patients with postburn leukoderma Comparison of two techniques to prepare the recipient site: Dermabrasion Versus Erbium: YAG laser

Public title

efficacy of skin pigment suspension in treatment of white burn scars

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: Age ≥ 18 years; Non-pregnant and non-breast feeding women; without history of chronic diseases, skin cancer, drug sensitivity/severe allergic reactions, immun deficient, organ transplant or steroid treatment; The absence of coagulopathy or anticoagulation therapy; No evidence of hypertrophic burn scar; The total area treated is >40 cm². Exclusion criteria: Previous treatment of skin lesions; Active systemic infection.

L81.5

ICD-10 code description

Leukoderma, not elsewhere classified

Primary outcomes**1****Description**

repigmentation scales

Timepoint

one, three and six months after the end of treatment

Method of measurement

by dermatology Colleagues blinded to the randomization

Secondary outcomes**1****Description**

Edema, Erythema, Infection and Dyspigmentation

Timepoint

One week, one month, three months and six months after treatment

Method of measurement

Eye Clinical Evaluation

Intervention groups**1****Description**

After preparing melanocyte suspension according to patent No.139250140003003854, dermabrasion performed by high-speed motor dermabrator and Suspension will be transferred to the desired location. It is then covered by a mepitel bandage. Patients treated with oral antibiotics for a week (Cephalexin 500 mg Q6h). In the first follow-up a week later removed the bandage. From the third week UVA phototherapy is administered weekly for 3 months.

2**Description**

After preparing melanocyte suspension according to patent No.139250140003003854, Suspension by Erbium YAG laser (lotus II, laseropteck company, Seoul, Korea, 2012) with wave length 2940 nm, spot size 3 mm, pulse energy 1200 mj and 2 laser passes will be transferred to the desired location. It is then covered by a mepitel bandage. Patients treated with oral antibiotics for a week

(Cephalexin 500 mg Q6h). In the first follow-up a week later removed the bandage. From the third week UVA phototherapy is administered weekly for 3 months.
