The effect of the spiritual care on life expectancy and death anxiety in patients with end-stage chronic kidney disease under hemodialysis

Protocol summary

Summary

Goal: effects of spiritual care on life expectancy and death anxiety of patients undergoing hemodialysis with end-stage chronic renal failure in the case and control group Design of the study: Randomized Population of the study: Patients undergoing hemodialysis with end-stage chronic renal failure Sample size: Sixty patients Interventions: Effects of spiritual care on life expectancy and death anxiety Blinding: Not blinded Trial phase: 2-3 Study Design: Interventional One central Primary outcome measure: Life expectancy and Death anxiety Inclusion criteria of the study: 1. end-stage chronic renal failure confirmed by the physician, 2. knowing the diagnosis and prognosis of their disease. Exclusion criteria of the study: 1. incidence of any stressful event for patients once the study has begun, 2. unwillingness to continue the study for any reason.

Scientific title

The effect of the spiritual care on life expectancy and death anxiety in patients with end-stage chronic kidney disease under hemodialysis

Public title

The Effect of Spiritual Care on Life Expectancy and Death Anxiety in Hemodialysis patients.

Purpose

Supportive

Inclusion/Exclusion criteria

Inclusion criteria of the study: 1. end-stage chronic renal failure confirmed by the physician, 2. knowing the diagnosis and prognosis of their disease, 3. hemodialysis at least for 6 months, 4. having physical and mental capability of answering the questions, 5. not knowing the mental disorders diagnosed by the physician, and 6. having minimum ability of reading and writing. Exclusion criteria of the study: 1. incidence of any stressful event for patients once the study has begun, 2. unwillingness to continue the study for any reason, and 3.

hospitalization because of the disease relapse.

Age

From **15 years** old to **70 years** old

Intervention groups

1

Description

The case group: (1): The case group will receive spiritual care besides the routine treatments. The patients in the case and control group will complete a demographic information questionnaire before the intervention. The patients in the case and control group will also complete the Templer's death anxiety scale and Schneider's life expectancy scale before and after the intervention. Mean score of death anxiety and life expectancy of the two groups before and after the intervention will be eventually presented and compared. Prior to implementation of the spiritual care program, library resources and articles will be reviewed to prepare a care training package (booklets and CDs) for hemodialysis patients in the case group. The spiritual care program in this study will be held in four one-hour sessions individually twice a week in the morning or evening shift at bedside in the hemodialysis ward. The spiritual care model in the case group will include the following items: A- supportive presence involving the following items: 1. developing trust, empathy, and honesty between nurses and patients to establish a good relationship during sessions, 2. carefully listening to the patients' words, concerns, and fears, 3. supporting the patients spiritually and mentally, 4. enhancing patients' hope and inner forces, 5. uttering positive sentences and reinforcing sound constructive thoughts, 6. communicating with patients verbally and non-verbally, 7. answering patients' questions, explaining the course of treatment to the patients, and providing them with information on their disease in order to diminish their physical and mental stresses, and 8. encouraging the patients to use recreational places, B- support patients' rituals: 1. helping the patients to find meaning of their life and the fact that no event is out of the divine providence, 2. providing necessary facilities for doing religious practices (including a turbah and a prayer rug and recommending

patients' family to help the patients in saying prayers), 3. encouraging the patients to say prayers and read Quran, 4. encouraging the patients to express their religious beliefs, and 5. encouraging the patients to talk with clergymen, and C- use of supportive systems: 1. encouraging the patients to communicate with people with whom they feel comfortable, 2. supporting the patients emotionally on the part of patients' family and medical team such that the patients feel valued, including loving, accepting, and respecting them, 3. recommending patients' family to help the patients do their daily activities, such as household chores, and 4. encouraging the patients to go to work. It should be noted that the first session involve principles on the supportive presence. The support for patients' rituals will be emphasized in the second session. The third session will be dedicated to patients' use of specific supportive systems. The materials taught in the first three sessions will be concluded in the fourth session, and the patients will be requested to express their views and questions about the spiritual care provided for them. It will be tried to obviate any ambiguity that may arise about the training materials.
