Effectiveness of oral ketamin,Midazolam and Atropine cocktail versus oral Diphenhydramin for pediatric Sedation in Emergency Department

Protocol summary

Summary

In a randomized double-blind prospective clinical trial performed in Imam Reza Hospital Emergency Department, 80 infants and children aged 2-10 years with wounds requiring local anesthesia for performing sutures will be included. Prior to the study, parental written informed consents will be obtained. Sampling will be performed confidentially and randomly. Patients will be divided into groups 1 and 2 as follows: Group 1: patients having received oral diphenhydramine for sedation. Group 2: patients having received oral ketamine, midazolam, and atropine for sedation. Medicine acceptance by the child and his/her anxiety will be registered via questioning the parents. If local anesthesia is required, those with anxiety scale of more than 1 will enter the study. Infiltration of the local anesthetic will be registered based on the tranquility degree every 5 minutes. For scores more than 4, or at least 45 minutes later, the tranquilizer will be administered. After the patient sitting on the examination bed, nasal mask will be placed. Consciousness status of the patient will be monitored regularly. All the oral administration of the medicines will be performed under the supervision of an emergency medicine. All behavioral patterns of the child including cry, consciousness, and movement throughout the procedure will be registered and evaluated based on the Houpt scale by a third colleague. In addition to the evaluation of the behaviors of the child, treatment will be performed based on the Houpt scale. After two weeks from the hospital discharge, the probable behavioral changes within two weeks will be registered via telephone connection with the parents. The obtained data will be analyzed using SPSS 16 and to the study the relation between the variables, Chi-square and Mann-Whitney U test will be used. A P value less than 0.05 will be considered statistically significant.

Health conditions studied**1****Description of health condition studied**

sedation during procedure

ICD-10 code

T88.52

ICD-10 code description

sedation(conscious) (moderate) during procedure

Primary outcomes**1****Description**

sedation

Timepoint

Every 5 minutes to 45 minutes after administration of sedatives

Method of measurement

Grade 1: drowsiness, the patient needs a stimulus for waking up- Grade 2: drowsiness, the eyes are closed and patient needs a mild verbal or touch stimulus for waking up- Grade 3: drowsiness, the eyes are open but the eye responsiveness has reduced to low activity- Grade 4: complete awakesness- Grade 5: complete agitation

Secondary outcomes**1****Description**

All behavioral patterns of the child including cry, consciousness, and movement throughout the procedure

Timepoint

When local anesthetic injecting and during the procedure

Method of measurement

Based on the Houpt scale

Intervention groups**1****Description**

Oral Diphenhydramin : 0.5mg/kg

Category

Prevention

2**Description**

Oral ketamin(6mg/kg), Midazolam(0.05mg/kg) and Atropine(0.02mg/kg) cocktail
