Review and Comparison of sedative effect in using of chloral hydrate and midazolam on children under voiding cystourethrogram

Protocol summary

Registration timing: **retrospective**

Summary

Since VCUG is an offensive method that is unpleasant and stressful to children and parents. The aim of this study was to compare the effects of injection Midazolam and oral Chloral hydrate for decreasing stress and increasing cooperating children in VCUG. For this purpose among referral patients from nephrologist to Amir Kabir hospital 150 children selected randomly and divided to three groups. Initially 30 minutes before test midazolam was injected to first group, oral Chloral hydrate was given to second group and was not given drugs to third group. Unlike routine VCUG process that not use of sedation, in this study two above drugs were used. Then a questionnaire to measure the child's cooperation during the test, ease of separation of children from parents, residual urinary volume and adverse drug reactions by resident based on observations of children's behavior during testing project was completed and the results of groups were compared and investigated. In the following the conditions of study are mentioned: Entrance general conditions to Study including: children from 2-12 years old both male & female; Children with indication VCUG; children with ASA 1 or 2; obtaining the informed consent from parents or guardian of children To participate in the study and Exclusion general conditions from Study including: History of systemic chronic diseases such as Renal failure, Respiratory disease and etc; history of narcotic abuse; history sensitivity to midazolam or chloral hydrate; history chronic psychiatric disease including: ADHA, Anxiety, Depression, psychos and Metal retardation
