Comparison of analgesic effect of Morphine versus Fentanyl in isolated closed femor fracture in trauma patients

Protocol summary

Summary

This study is a single blind randomized clinical trial to compare the effects on pain and morphine, fentanyl pain in patients with femoral shaft fractures were admitted to the emergency. Inclusion criteria: patients with femur fractures, one-sided, single and classification of 1 or 2 ASA; patients 18 to 55 years of both sexes; a maximum of 20 minutes after arrival to the emergency department trauma. Exclusion criteria were: decreased level of consciousness (GCS less than 14) and neural tube defects (FND); respiratory depression, hypotension (systolic blood pressure <90) and generally patients with hemodynamically unstable; multiple trauma (injury to intra-abdominal organs, bleeding Notably, head trauma); Tyad to drugs. Patients in group 1 (35 patients receiving 1.0 mg kg intravenous morphine sulfate with distilled water to a final volume reached 10 ml) and group 2 (35 patients, 5.1 mg kg group receiving fentanyl intravenous (12)) are. Two groups of patients before and after injection (0), 15 minutes and 30 minutes after treatment by visual analogue scale (Visual Analog Scale- VAS) are evaluated, as well as possible side effects and vital signs (blood pressure systolic and diastolic, heart rate and respiratory rate, body temperature) and arterial oxygen saturation, as well as in patients by Czech list has been prepared for this purpose, is recorded.

Health conditions studied

1

Description of health condition studied

femor fracture

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description

Systolic blood pressure

Timepoint

Before and after injection (0), 15 minutes and 30 minutes after taking drugs.

Method of measurement

Sphygmomanometer

2

Description

Diastolic blood pressure

Timepoint

Before and after injection (0), 15 minutes and 30 minutes after taking drugs.

Method of measurement

Sphygmomanometer

Secondary outcomes

1

Description

heart beat

Timepoint

Before and after injection (0), 15 minutes and 30 minutes after taking drugs.

Method of measurement

ECG

Intervention groups

1

Description

Intervention group 1: 35 patients receiving 1.0 mg kg intravenous morphine sulfate that has been distilled water to a final volume of 10 ml.

Category

Treatment - Drugs

2

Description

Intervention group 2: 35 patients in the group receiving 5.1 micrograms per kilogram of Fentanyl are.

Category

Treatment - Drugs
