Effect of continuous care pattern on self-care behaviors of hospitalized heart failure patients

Protocol summary

Summary

Objectives: The aim of this study is to determine the effect of continuous care model on self-care behaviors in patients with heart failure in the Abbasi hospital of Miyandoab. Design: randomized, single blinded, controlled trial in which patients with heart failure will be included in the study by convenient sampling method and then assigned to the experiment and control groups using random allocation, without placebo. The study is a quasi-experimental clinical trial with pre- and post-test design. The experiment group will receive follow-up based on continuous care model during 3 months of the study period and the control group will received only routine cares. Inclusion criteria: subjects over 30 years with heart failure based on clinical symptoms; ECG and echocardiography; classification in level II and III heart failure based on category system of New York Heart Association; availability for follow up during the study, and informed consent to participate in the study. Exclusion criteria: patients with severe mental or cognitive disorders; patients with a history of working in therapeutic centers; receiving information about self-care of heart failure disease. Intervention: after completing the research forms, the experiment group will be followed-up based on self-care model for three months. Control group will receive the routine care without any education. Then the items related to self-care behaviors will be assessed in both groups by a questionnaire and compared. Main outcome variable: maintenance, management, and assuring of self-care behaviors among patients with heart failure.

Scientific title

Effect of continuous care pattern on self-care behaviors of hospitalized heart failure patients

Public title

The impact of education on self-care behaviors in patients with heart failure

Purpose

Prevention

Inclusion/Exclusion criteria

Inclusion criteria: subjects over 30 years with heart failure based on clinical symptoms; ECG and echocardiography which represent ejection deficiency less than 40 percent; classification in level II and III heart failure based on categorization system of New York Heart Association; availability for follow up during the study; informed consent to participate in the study. Exclusion criteria: patients with severe mental or cognitive disorders; patients with a history of working in therapeutic centers; receiving information about self-care of heart failure disease.

Chek list

Intervention groups

1

Description

Experiment group: this group will complete specific questionnaire of self-care indicators. The continuous care

model consisting of 4 stages of orientation, sensitization, implementation and evaluation will be deployed. The first stage will be orientation stage and providing the background the necessary sensitivity. Sessions of 30 to 45 minutes will be attended by the patients and their families. Demographic characteristics as well as specific questionnaire of self-care indicators in patients with heart failure will be completed.

Category

Prevention

2**Description**

Control group will receive routine cares without any educational program. After three months, again the items related to self-care behaviors will be assessed by the questionnaire.
