Comparative clinical trial of low dose Pregabalin versus Gelofen in decreasing postoperative pain in patients after mandibular third molar surgery

Protocol summary

Summary

The purpose of this study is Comparison of low dose Pregabalin versus Gelofen on postoperative pain reduction in third molar extraction patients. In this randomized, single blind clinical trial, a number of twenty five patients, 18 – 40 yr old, inclusion criteria: candidate for third molar extraction; lack of severe cardiac and mental disease; consent to take a share in the study and exclusion criteria: history of drug allergy; opiate and sedative use. According to the random numbers chart they are split into two groups: Pregabalin and Gelofen. At the end of surgery study group takes 75 milligram Pregabalin orally or 400 milligram Gelofen orally with a glass of water. Third molar extraction is performed by one surgeon with same surgical technique under local anesthesia. One month afterwards, the procedure will repeat for contralateral tooth and the drug will change. At the end of surgery before discharge, and every two hours until twelve hours after surgery, pain measure and record by a collaborator who does not know about grouping by using a visual index (Visual Analogue Scale) and analyzed.
