

Clinical Trial Protocol

Iranian Registry of Clinical Trials

18 Sep 2026

A Clinical trial to compare the effect of ostrich oil versus placebo on pain in patients with musculoskeletal disorders

Protocol summary

Summary

Purpose: Studying effects of ostrich oil on musculoskeletal pain comparing with the placebo effect.
Method: 60 patients with musculoskeletal pain without history of operation and injection will be included in this study. In case of dissent or requirement of operation or splint, they will be excluded. Using Excel software, we divided the numbers 1-60 into two groups randomly. The numbers will be allocated to drug (Ostrich oil) and placebo (Olive oil) groups. Random packets containing the prescriptions will be provided. Sealed packets will be given to patients randomly whereas the inside information is not visible and patients and the physician won't be aware of the grouping. Ostrich oil and olive oil will be previously kept in hospital's drug store and patients will receive the oil by going to the drugstore. Patients' names and their specific codes will be recorded in a log. Each patient will receive a packet and a brochure containing the instruction. Patients will be asked to spray the topical medication on the skin twice per day and massage it for 5 minutes. Follow-up visits will be after 1 week (5-10 days), 2 weeks (10-16 days) and a month (4-6 weeks) and related questionnaires will be completed by an examiner who also won't be aware of the groups. The outcomes such as amount of pain, symptom improvement time, area of pain, and quality of life will be measured.

General information

Scientific title

A Clinical trial to compare the effect of ostrich oil versus placebo on pain in patients with musculoskeletal disorders

Public title

The effect of ostrich oil on musculoskeletal disorders' pain

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: Being an adult and having musculoskeletal pain; Having no medical history of injection, surgery and topical medicine on the area.
Exclusion criteria: No willingness for participation; Requiring to use brace or cast; Having other conditions such as CTS; Requiring physical therapy; Having history of surgery on the area .

Age

From **18 years** old to **70 years** old

Gender

Both

Phase

N/A

Groups that have been masked

No information

Sample size

Target sample size: **60**

Randomization (investigator's opinion)

Randomized

Randomization description

Blinding (investigator's opinion)

Triple blinded

Health conditions studied

1

Description of health condition studied

Musculoskeletal pain

ICD-10 code

M79.1

ICD-10 code description

Myalgia

Primary outcomes

1

Description

Pain intensity

Timepoint

Before intervention, and 1 week(5-10 days), 2
weeks(10-16 days), one month(4-6 weeks) after
intervention

Method of measurement

VAS and McGill questionnaire

Secondary outcomes

1

Description

Symptoms improvement time

Timepoint

At the beginning and at the end of the trial

Method of measurement

VAS and McGill questionnaire

2

Description

Area of pain

Timepoint

Before and after the intervention

Method of measurement

using the "area of pain" diagram and software for
calculating the area

3

Description

Quality of Life

Timepoint

Before and after intervention

Method of measurement

WHOQOL questionnaire

Intervention groups

1

Description

Intervention group: Each patient will receive a packet
and a brochure containing the instructions. Patients will
be asked to spray the topical medication(ostrich oil) on
the skin twice per day and massage the area for 5
minutes. The oil is provided by Prolife Company.

Category

Treatment - Drugs

2

Description

Control group: Each patient will receive a packet and a brochure containing the instruction. Patients will be asked to spray the topical medication(olive oil) on the skin twice per day and massage it for 5 minutes. The oil is provided by Prolife Company.

Category

Placebo
