The effect of umbilical cord milking on neonatal outcome in preterm infants

Protocol summary

Summary

The objective of this interventional study is to compare the neonatal outcomes between the infants with milked umbilical cord and infants without it, 80 pregnant women with a gestational age of 28-34 weeks who were admitted for normal delivery or cesarean section at Shariati Hospital of Bandar Abbas and they lacked the exclusion criteria (Cord less than 25 cm; Vigorous or Meconiumstain; Motility, ABO or Rh negative mother; Congenital major anomalies; Umbilical cord prolapse; Phytoplasmic hydrops; Placenta; Placental decompression; true umbilical knot and maternal diseases such as maternal diabetes mellitus; maternal hypertension) were randomly divided into two groups. In group 1, after delivery by natural delivery the baby is positioned at the uterus and in delivery by cesarean section along the thigh. Immediately the umbilical cord will be disconnected 25 cm from the navel surface and placed under the Warmer, then the umbilical cord Raised and taken three times at the cut off end at the speed of 10 cm / s to the baby's side, and will eventually be cut from the distance of 2 cm above the navel get clamped and will be cut off. In group 2, after delivery by natural delivery the baby is positioned at the uterus and in delivery by cesarean section along the thigh and the cord is cut off without dipping. It is then compared for neonatal outcomes including birth hemoglobin and hematocrit, Neonatal hypertension, respiratory distress, jaundice requiring phototherapy, IVH, Hypercalcemia, and volume of injected blood.

Health conditions studied

1

Description of health condition studied

Preterm infant

ICD-10 code

P07.30

ICD-10 code description

Preterm newborn, unspecified weeks of gestation

Primary outcomes

1

Description

Hemoglobin premature infants

Timepoint

48 hours after birth

Method of measurement

According to the results reported by the laboratory of Shariati Hospital and expressed in grams per liter of blood.

Secondary outcomes

1

Description

Intrauterine pulmonary edema

Timepoint

After birth

Method of measurement

Intravenous hemorrhage of the baby, expressed on the basis of sonography.

2

Description

Infant hematocrit

Timepoint

48 hours after birth

Method of measurement

Based on the results reported by Shariati Hospital's laboratory, it is expressed in terms of percentage and number.

3

Description

Primary neonatal hypertension

Timepoint

After birth

Method of measurement

Based on the report reported by Shariati Hospital's laboratory based on mmHg and with the number.

Intervention groups

1

Description

In case group, after delivery by natural delivery the baby is positioned at the uterus and in delivery by cesarean section along the thigh. Immediately the umbilical cord will be disconnected 25 cm from the navel. The baby will be placed underneath the warmer and the umbilical cord

was raised, 3 times from the cut off end at the speed of 10 centimeters per second toward the infant, and finally, 2 cm above the navel, the umbilical cord is clamped and cut off.

Category

Treatment - Surgery

2

Description

In the control group, after delivery by natural delivery the baby is positioned at the uterus and in delivery by cesarean section along the thigh. Immediately the umbilical cord will be disconnected 25 cm from the navel surface and placed under the Warmer, and the umbilical cord is removed from the spacing 2 cm above the navel, get clamped and will cut off.
