

Clinical Trial Protocol

Iranian Registry of Clinical Trials

10 Jun 2026

Comparison of immediate effects following postro-anterior mobilization technique and Mulligan sustained natural apophyseal glide on chronic nonspecific low back pain

Protocol summary

Study aim

Comparison of immediate effect of sustained natural apophyseal glide and posterior-anterior techniques in non-specific chronic low back pain

Design

A concealed, randomized, double-blinded, multi-center, sham controlled clinical trial with a parallel group design of 45 patients

Settings and conduct

Three physiotherapy centers selected for sampling and 45 patients included to study after receiving informed consent. Each patient were entered to one of three groups (SNAG, PA Mobilization & sham) by block balanced randomization and received intervention by an expert manual therapist. All patients were assessed before and immediately after the intervention by another researcher who was blinded to patients allocation. Also all patients were blinded to groups because sham intervention was similar to SNAG technique.

Participants/Inclusion and exclusion criteria

Patients were included with localized chronic non-specific low back pain, age between 20 to 50 years, that their pain were worsened during flexion and L4 as most painful lumbar segment. Patients with any type of sensory or motor disorders, malignancy, osteoporosis or any type of contraindication of mobilization excluded.

Intervention groups

Sustained natural apophyseal glide (SNAG) on L4 during 4 sets of 6 repetitions with 30 seconds rest between sets with cranial direction. Posterior-anterior mobilization on L4 with grade 3 during 4 sets of 30 seconds duration with 30 seconds rest between them. Sham intervention likes SNAG technique, but only skin touch without mobilization and caudal direction during 2 sets of 4 repetitions.

Main outcome variables

Pin Pressure threshold (PPT) at 3 cm right to L3 spinous process, L3 dermatome, L4 dermatome and S1

dermatome; Flexion, Extension, Right and Left Lateral bendings and rotations range of motions; Pain at rest and during forward flexion.

Scientific title

Comparison of immediate effects following postro-anterior mobilization technique and Mulligan sustained natural apophyseal glide on chronic nonspecific low back pain

Public title

Comparison the efficacy of two manual therapy methods (postro-anterior & Mulligan sustained natural apophyseal glide) on low back pain

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

age between 20 to 50 Low back pain for more than 12 weeks Pain at center of lumbar region (with or without radiating to distal of buttock(s) region which intensify with forward flexion, but first half flexion in painless Pain is equal to or greater than three by VAS Can understand the commands willingness to participate in the study

Exclusion criteria:

Disorders like malignancy, hemorrhagic, wound, infection, sensory-motor deficits or any other pathology Surgery or injection at lumbar region Osteoporosis or history of fracture at lumbar or lower extremity Any factor which prevents patient to lie prone (such as asthma or pacemaker) or limited range of motion in knee or ankle Diabetes melitus Any contraindication of mobilization Sever mental disorder Pregnancy Spondylolisthesis and sacralization Patient withdrawal of cooperation Patient discomfort and intolerance

Age

From **20 years** old to **50 years** old

Gender

Sample size

Target sample size: **45**

Actual sample size reached: **45**

Randomization (investigator's opinion)

Randomized

Randomization description

Block balanced randomization

Blinding (investigator's opinion)

Double blinded

Blinding description

Block balances randomization set before trial starting and was wrote in closed envelopes and sort them by number. Every participant that entered in study,

therapist opened one envelope to find participant's grouping, but assessor was not aware about patient's group, because assessment was done in another room. Our sham treatment was very similar to Mulligan technique. therefore, No patient found that this was not real treatment, therefore patients and assessor were not aware about groups and only therapist was aware.

Health conditions studied

1

Description of health condition studied

Low Back Pain

ICD-10 code

M54.5

ICD-10 code description

Low back pain

Primary outcomes

1

Description

Pain Pressure threshold

Timepoint

Before and immediately after intervention

Method of measurement

By pressure algometer at 3 cm right to L4 vertebrae, L3-L4-S1 dermatome of right lower extremity and left mid-deltoid

Secondary outcomes

1

Description

Pain

Timepoint

Before and immediately after intervention

Method of measurement

Visual analog scale

2

Description

Forward flexion

Timepoint

Before and immediately after intervention

Method of measurement

Inclinometry

3

Description

Backward extension

Timepoint

Before and immediately after intervention

Method of measurement

Inclinometry

4

Description

Right and Left side bending

Timepoint

Before and immediately after intervention

Method of measurement

Goniometry

5

Description

Right and left trunk rotation

Timepoint

Before and immediately after intervention

Method of measurement

Goniometry

Intervention groups

1

Description

Intervention 1: Mulligan Sustained natural apophyseal glide technique as intervention with 6 repetition during 4 sets and using mulligan belt

Category

Treatment - Other

2

Description

Intervention 2: Posterior-anterior mobilization technique as intervention 30 seconds at 4 sets and 30 seconds rest

between them.

Category

Treatment - Other

3

Description

Control group: Sham technique of SNAG4 repetition of 3 sets forward flexion with caudal direction touch

Category

Treatment - Other
