Evaluating of effect of infiltration of bupivacaine local anesthetic to port site in post-operative pain relief in laparoscopic cholecystectomy

Protocol summary

Summary

This double blind randomized clinical trial was performed on 60 patients with ASA I or II who were candidate for laparoscopic cholecystectomy in Velayat hospital in Qazvin of Iran. The age of patients ranged 20 to 70 years. Patients with history of diabetes, former bile ducts surgeries, sensitivity to local anesthesia drugs and addiction were excluded from the study. Patients were divided into case group (n: 30) and control group (n: 30) using randomized block design. Both groups received the same anesthesia method. In case groups; at the end of surgery before closing the surgical incision; 10 cc Bupivacaine 0.25% into two trocar sites(In each place 5 cc) were infiltrated. In control group; 10 cc normal saline into two trocar sites (In each place 5 cc) were infiltrated. Postoperative pain was recorded with the use of a visual analog scale at 1, 2, 4, 12 and 24 hours intervals after the surgery. Analgesia requirements and incidence of nausea and vomiting were also recorded.

Scientific title

Evaluating of effect of infiltration of bupivacaine local anesthetic to port site in post-operative pain relief in laparoscopic cholecystectomy

Public title

Evaluating of effect of infiltration of bupivacaine local anesthetic in post-operative pain relief in patients undergoing Laparoscopic Gallbladder Surgery

Purpose

Prevention

Inclusion/Exclusion criteria

Inclusion criteria: patients 20 to 70 years old; the category of America Society of Anesthesiology (ASA) are class 1 and 2; undergoing elective surgery laparoscopic cholecystectomy; consent to participate up to the end study. Exclusion criteria: patients with history of Diabetes; former bile ducts surgeries; sensitivity to local

anesthesia drugs; addiction.

Age

From **20 years** old to **70 years** old

Gender

Both

Phase

3

Health conditions studied

1

Description of health condition studied

Postoperative pain

ICD-10 code

T88.9

ICD-10 code description

Complication of surgical and medical care, unspecified

Primary outcomes

1

Description

post operative pain

Timepoint

At 1, 2, 4, 12 and 24 hours after surgery

Method of measurement

According to VAS pain score systems

2

Description

nausea and vomiting

Timepoint

Every 1 hour during first 4 hours after transferring to the ward

Method of measurement

questionnaire

Secondary outcomes

empty

Intervention groups

1

Description

In case groups; at the end of surgery before closing the surgical incision; 10 cc Bupivacaine 0.25% into two trocar sites(In each place 5 cc) were infiltrated.

Category

Prevention

2

Description

In control group; at the end of surgery before closing the surgical incision; 10 cc normal saline into two trocar sites (In each place 5 cc) were infiltrated.
