The effect of the gradual reduction of liquid sodium dialysis hypotension, muscle cramps and plasma sodium levels in hemodialysis patients

Protocol summary

Summary

The purpose of this study was to evaluate the effect of gradual reduction of sodium dialysis fluid on the occurrence of hypotension, muscle cramps and plasma sodium levels in dialysis patients. The relationship between calcium and magnesium with cramp is also assessed and randomized and triple blind clinical trials. Entry: Patients with end-stage renal failure, aged 75-18, who have been undergoing hemodialysis 2-3 times a week for at least two months, and patients who are willing to participate in the project. Exit criteria: Patients who use anti-cramp therapy, patients diagnosed by a physician Blood pressure is not controlled, use of low blood pressure medications in the morning Before dialysis, the presence of a pacemaker is a heart attack such as a heart attack during the last six months and a discharge fraction of less than 30%. The sample size is 106 people. In the first intervention, the patients in the control group were routinized (sodium dialysis solution mEq / l138 in the total duration of dialysis) and the patients in the test group gradually reduced the sodium dialysis solution (starting with 150 mEq / l and reducing it every 15 minutes and then fixing it This concentration will be dialysed for three sessions. Subsequently, both groups undergo dialysis with routine three sessions. Then, using the cross over method, the patients will be replaced in two groups and both groups will dial for three sessions. At this time, patients will be checked for 5 times the blood pressure and muscle cramps are asked and sodium / calcium / magnesium before And after dialysis, it is checked at all stages

Scientific title

The effect of the gradual reduction of liquid sodium dialysis hypotension, muscle cramps and plasma sodium levels in hemodialysis patients

Public title

The effect of the gradual change in liquid sodium dialysis hypotension and cramps and blood sodium dialysis patients

Purpose

Prevention

Inclusion/Exclusion criteria

Inclusion criteria include patients with end-stage renal failure (ESRD); patients aged between 75 and 18, who have been undergoing hemodialysis 2-3 times a week for at least two months; and patients who are willing to participate in the plan. Exclusion criteria include patients who use anti-cramp medication; patients who are not under the control of their physician's blood pressure department; use of medications to lower blood pressure in the morning before dialysis; heart disease, such as heart attack, over a period of six months Recent; patients with discharge fraction of less than 30%; the presence of pacemakers in patients.

Health conditions studied

1

Description of health condition studied

kidney disease

ICD-10 code

N19

ICD-10 code description

Unspecified kidney failure

Primary outcomes

1

Description

Blood pressure

Timepoint

Before dialysis, first, second and third and fourth hours of dialysis, the dialysis

Method of measurement

-Br millimeters of mercury using mercury manometer

2

Description

Muscle cramps

Timepoint

Before dialysis, during dialysis, the dialysis

Method of measurement

questionnaire

3

Description

Plasma sodium

Timepoint

Before dialysis, the dialysis

Method of measurement

In terms of mEq per liter by laboratories

Secondary outcomes

1

Description

Hypotension during dialysis

Timepoint

Before dialysis, during dialysis, the dialysis

Method of measurement

-Br millimeters of mercury using mercury manometer

2

Description

Magnesium is the blood

Timepoint

Pre-dialysis and dialysis later

Method of measurement

Mg / dl

3

Description

Calcium of the blood

Timepoint

Pre-dialysis and dialysis later

Method of measurement

Mg / dl

Intervention groups

1

Description

Patients in the control group treated with routine method (sodium dialysis solution 138 meq per liter in total duration of dialysis) for three sessions of dialysis and then both intervention and control groups for a week routine dialysis were (Wash Out) using cross over of patients in the two groups will change and both groups for one week (three days) dialysis will be in both patients twice a week dialysis during the three sessions of dialysis evaluated fall.

Category

Prevention

2

Description

Intervention group patients on hemodialysis with the gradual reduction of sodium dialysis solution (starting with 150 meq per liter and cut it every 15 minutes, and then maintain this concentration) for one week (three days) will be dialysis. Both intervention and control groups for a week routine dialysis were (Wash Out) then using a cross over of patients in both groups will change and both groups for one week (three days) Dialysis and will both groups of patients who are on dialysis twice a week during the three sessions of dialysis evaluated.
