Comparison of blood sugar fluctuations in diabetic patients undergoing coronary artery bypass grafting; General anesthesia versus general anesthesia along with spinal anesthesia

Protocol summary

Summary

This study is a prospective and randomized double-blind clinical trial. The aim of this study is comparison of blood sugar fluctuations in diabetic patients undergoing coronary artery bypass grafting; general anesthesia versus general anesthesia along with spinal anesthesia. Total of sample size is 24 patient with ages: 50-65 years old. Inclusion criteria are diabetic patients candidate for coronary artery bypass surgery. The patients with heart block, cardiomegaly, kidney failure and hypothyroidism will be excluded. Patients are randomly divided into two groups with table of random numbers. Assessor of study and patients do not know about grouping people. Anesthesia induction in two groups is with 0.01 mg/kg midazolam, 3 mcg/kg fentanyl, 3 mg thiopental sodium and 0.6 mg/kg atracurium. All two groups receives 0.5 mg/kg midazolam intramuscularly, half an hour before surgery. First group will go under general anesthesia. Second group will go under general anesthesia along with spinal anesthesia. Patients basic information such as age and sex, BMI will be recorded in all two groups. Blood pressure, heart rate and blood glucose before induction, five minutes after induction and once every 15 minutes during surgery will be recorded in both groups.
