Comparison of Intravenous Ibuprofen And Intravenous Paracetamol In Reducing Migraine Headaches

Protocol summary

Summary

This study was conducted on migraine patients referred to the emergency department with the aim of examining the effectiveness of acetaminophen and comparing it with the efficacy of ibuprofen in reducing headache. The population studied was migraine patients referred to the Emergency Hospital of Iran's Medical Sciences Hospitals. The sample size is 400 people. This study is a double-blind randomized clinical trial that compares the effectiveness of drugs in two groups of patients with migraine. Patients registered in the first group of painkillers only have 800 mg of ibuprofen and patients in the other group of painkillers are prescribed only an injectable acetaminophen 1000 mg. At the time of referral, the severity of the patient's pain is recorded on the basis of the degree of pain rating, with a score of 0 to 10, and after two hours, the patient's pain is again scored on the same scale. Also, the number of doses of drugs and side effects Individual records are recorded in each patient's case and the data from the two treatment groups are compared

Health conditions studied

1

Description of health condition studied

Migraine

ICD-10 code

G43.0

ICD-10 code description

Migraine without aura [common migraine]

Primary outcomes

1

Description

The pain

Timepoint

Time zero and two hours later

Method of measurement

Visual analogue scale (vas)

Secondary outcomes

1

Description

Including stomach and intestinal ulcers and
gastrointestinal bleeding

Timepoint

Two hours later

Method of measurement

Examination

Intervention groups

1

Description

The intervention in the first group was 800 mg Ibuprofen
and repeat if needed two hours later

Category

Treatment - Drugs

2

Description

Intervention in the second group with ampoule of
Acetaminophen 1000 mg and repeat if needed two hours
later

Category

Treatment - Drugs
