Evaluation of local Deferoxamine impact on revascularization and improvement of avascular necrosis of the lunate bone (Kienbock's disease)

Protocol summary

Summary

Objectives: Kienbock's disease, is a rare, debilitating condition that can lead to chronic pain and dysfunction. It is caused by lack of blood supply for lunate bone. Desferoxamine is a drug with positive effects on angiogenesis and bone repair. Here we aim to evaluate the Deferoxamine effect on the vascularization of lunate bone in Kienbock's disease. Design: Clinical trial. Setting and conduct: A total of 10 Patients, referred to shafa orthopedic hospital, diagnosed with Kienbock's disease, will be assigned into intervention group. Inclusion and exclusion criteria: Inclusion criteria: Radiologic Diagnosis of the Kienbock's disease by 3 hand surgeons; Age of 18 to 60 years. Lack of hematologic disorders and any disease with platelet Dysfunction; Lack of any comorbid disorders that might increase the risk of surgery including uncontrolled diabetes, cardiovascular disorders, rheumatic diseases such as rheumatoid arthritis, cancers, hepatic and renal failure and etc; Consumption of no drug which affect bone restoration such as corticosteroids. Exclusion Criteria: New severe trauma affecting the fracture dislocation and fixation status, Incidence of severe infection which can not be controlled with antibiotics and needs surgery; Incidence of disorders needing specific drugs such as corticosteroids and chemotherapy which affect the bone repair. Intervention: Local Deferoxamine (500 mg) will be infused at days 0 and 14 along with the implication of external fixator. Main outcome measures: The outcome will be assessed using clinical (range of motion) and paraclinical (X-ray and MRI) measures.

Scientific title

Evaluation of local Deferoxamine impact on revascularization and improvement of avascular necrosis of the lunate bone (Kienbock's disease)		Postal code	
		Approval date	2010-09-23, 1389/07/01
		Ethics committee reference number	-
Public title	implication of Deferoxamine in the treatment of kienbock's disease	Health conditions studied	
Purpose	Treatment	1	
Inclusion/Exclusion criteria	Inclusion criteria: Radiologic Diagnosis of the Kienbock's disease by 3 hand surgeons; Age of 18 to 60 years. Lack of hematologic disorders and any disease with platelet Dysfunction; Lack of any comorbid disorders that might increase the risk of surgery including uncontrolled diabetes, cardiovascular disorders, rheumatic diseases such as rheumatoid arthritis, cancers, hepatic and renal failure and etc; Consumption of no drug which affect bone restoration such as corticosteroids. Exclusion Criteria: New severe trauma affecting the fracture dislocation and fixation status, Incidence of severe infection which can not be controlled with antibiotics and needs surgery; Incidence of disorders needing specific drugs such as corticosteroids and chemotherapy which affect the bone repair.	Description of health condition studied	Kienböck disease of adults
		ICD-10 code	M93.1
		ICD-10 code description	Adult osteochondrosis of carpal lunate
		Primary outcomes	
		1	
		Description	Clinical and radiologic symptoms
		Timepoint	Months 3, 6 and 12 of intervention
		Method of measurement	Range of Motion, Xray and MRI
		Secondary outcomes	empty
		Intervention groups	
		1	
		Description	Deferoxamine, 500mg, two sessions, once at the start of the study and once two weeks later.
		Category	Treatment - Drugs
