The comparison of the effect of High intensity laser therapy (HILT) versus low intensity laser therapy (LILT) on pain and functional improvement of the patients with non-specific chronic low back pain

Protocol summary

Summary

Objectives: Chronic low back pain is one of the most prevalent musculoskeletal disorders which has been attempted for many years to prescribe more efficient treatment protocols. Based on the literature, there are evidences for the effect of laser therapy on reduction of the pain in the back area but the priority of any kind laser therapy on the treatment of the low back pain is unknown, especially when considering the same dose level. Higher price of the high intensity laser therapy and also higher safety level demands on application of this kind of laser compared with low intensity laser therapy, shows the necessity of further researches on this filed to evaluate the effect of both kind of laser therapy at the same dose level. **Design:** present research is a single blinded randomized clinical trial study. **Setting and conduct:** Thirty participants with chronic low back pain (aged 18-40 Ys) will participated in the study via convenience sampling method. Initial assessment will include pain level detection by visual analogue scale and functional level evaluation by Oswestry questionnaire. Participants will be randomly divided in 3 groups, all engaged in 10 sessions therapy; first group will receive high intensity laser therapy, second group will receive low intensity laser therapy and the third group will receive placebo laser. All groups will receive routine physical therapy treatments. At the end of the treatment sessions and also 2 weeks after finishing the treatment the previously mentioned assessments will be done again. Anova test will be used for between group comparisons, if the data present with normal distribution otherwise Kruskal wallis test will be used.

Scientific title

The comparison of the effect of High intensity laser therapy (HILT) versus low intensity laser therapy (LILT) on pain and functional improvement of the patients with non-specific chronic low back pain

Public title

Effect of laser therapy on chronic low back pain

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: Age range between 18 -40 years; Low back pain from 3 months to one year; Pain level between 30 - 60 mm (VAS scale); No physical therapy and manual therapy in past 3 months; Gaining 20% to 70% of the score of the disability level questionnaire Exclusion criteria: Spondylolysis and Spondylolisthesis; Disc herniation; Inability to sit, stand and forward bending for the short time due to severe pain or weakness or balance impairment; Vertebral anomaly; Pregnant women; History of low back and pelvic surgery; Diabetes, Rheumatoid arthritis and any kind of sensory impairment like neuropathy

Age

From **18 years** old to **40 years** old

Gender

Both

Phase

N/A

Groups that have been masked

No information

Sample size

Target sample size: **40**
