Iranian Registry of Clinical Trials

14 Jul 2026

Investigation of the effects of camel milk on spirometric parameters of children aged over 6 years with asthma

Protocol summary

Study aim

Determination of the effect of camel milk on spirometric parameters of children aged over 6 years with asthma who refer to Doctor Sheikh Hospital

Design

This clinical trial is randomized and performed on 50 patients aged over 6 years (25 people in each group) without blinding and consists of control and parallel groups

Settings and conduct

This clinical trial is conducted on patients with asthma who refer to Doctor Sheikh Hospital in Mashhad. Patients will be provided with necessary advice on avoiding allergen (edible and inhalable) orally and in written form. Patients are randomly assigned to 2 groups. Control group receives medication treatment and the second group, in addition to the medication treatment, receives 200 cc of pasteurized camel milk daily for 2 months.

Participants/Inclusion and exclusion criteria

Inclusion criteria: children aged over 6 years with asthma classified as "not well control" in spirometry according to Nelson's book, Forced Expiratory Volume in First Second (FEV1) is 60-80% and Forced Expiratory Volume in First Second/Forced Vital Capacity (FEV1/FVC) is 75-80%. Patients are under controller therapy. Patients are not under asthma attack. Exclusion criteria: Asthma attack during the investigation period, unwillingness to continue participation in the study, creation of any sensitivity and intolerance to camel milk during the course

Intervention groups

Control group: Patients will receive medication treatment (inhaled corticosteroids, montelukast and long-acting beta-agonists) according to the standard protocol. Intervention group: In addition to medication treatment (inhaled corticosteroids, montelukast and long-acting beta-agonists), patients will receive 200 cc of pasteurized camel milk daily for 2 months.

Main outcome variables

more than 80% change in FEV1 and FEV1/FVC

Asthma

Primary outcomes

1

Description

Percentage of people whose Forced Expiratory Volume in First Second (FEV1) exceeds 80%

Timepoint

At the beginning of the study (before the intervention) and two months after beginning drug use (after the intervention)

Method of measurement

spirometer device

2

Description

Percentage of people whose Forced Expiratory Volume in First Second/Forced Vital Capacity (FEV1/FVC) exceeds 80%.

Timepoint

At the beginning of the study (before the intervention) and two months after beginning drug use (after the intervention)

Method of measurement

spirometer device

Secondary outcomes

empty

Intervention groups

1

Description

Control group: Patients will receive medication treatment (inhaled corticosteroids, montelukast and long-acting beta-agonists) according to the standard protocol.

Category

Treatment - Drugs

2**Description**

Intervention group: In addition to medication treatment (corticosteroids, montelukast and long-acting beta-agonists according to the standard protocol), patients will receive 200 cc of pasteurized camel milk daily for 2 months.

Title and more details about the data/document

All data can be shared after patients are made unidentifiable.

When the data will become available and for how long

Data can be accessible 6 months after results are published.

To whom data/document is available

Data will be available for researchers in universities and other scientific institutes.

Under which criteria data/document could be used

Carrying out analysis on data is permitted.

From where data/document is obtainable

Data can be accessible through sending an email to the corresponding author.

What processes are involved for a request to access data/document

After sending a request email to the corresponding author, data will be sent in 1 month.
