The comparison of two methods of ventilation (Bag mask ventilation vs Semi-open ventilation) on O2 saturation of patients undergoing Electro Convulsive Therapy (ECT)

Protocol summary

Summary

The aim of this single-blind randomized trial is to assess the effect of semi-open ventilation system on arterial oxygen saturation. In this study, 72 eligible patients who are scheduled for electroconvulsive therapy under general anesthesia are conducted to the study. The patients are divided into two groups (Control and Test) using random allocation. During anesthesia, the patients in the Test group are ventilated by semi-open system and the patients in the Control group are ventilated by Ambu-bag system. Arterial oxygen saturation (SpO₂) is recorded before and after preoxygenation as well as before convulsion as basic data. Arterial oxygen saturation is recorded one-minute interval after convulsion until recovery of spontaneous ventilation is adequate. Statistical analysis is done after collecting date.

Scientific title

The comparison of two methods of ventilation (Bag mask ventilation vs Semi-open ventilation) on O₂ saturation of patients undergoing Electro Convulsive Therapy (ECT)

Public title

The comparison of two methods of ventilation during Electro Convulsive Therapy (ECT)

Purpose

Prevention

Inclusion/Exclusion criteria

Inclusion criteria: candidates for ECT; age of 18-50 years; ASA 1 or 2 Exclusion criteria: patients with cardiovascular or respiratory diseases; ASA 3 or 4; patients with internal medicine diseases; lack of consent

Age

From **18 years** old to **50 years** old

Gender

Both

Phase

N/A

Groups that have been masked*No information***Sample size**

Target sample size: 72
