Effectiveness of Emotion-focused group therapy on Emotional expressiveness and sexual functioning in women with type 2 diabetes

Protocol summary

Summary

Objective: The aim of this study was to investigate effectiveness of Emotionally focused group therapy (EFT) on improving emotional expressiveness and sexual function in women with type 2 diabetes. Design: Statistical population consisted of all women with type 2 diabetes that recruited through DaneshAmoz Health Center in Mashhad city in 2015. 24 women diagnosed with type 2 diabetes were chosen via available and judgmental sampling. Setting and conduct: It was used emotional expressiveness Questionnaire (EEQ) and Female sexual function Index (FSFI). 24 women diagnosed with type 2 diabetes were selected and they were assigned randomly in to an experimental group and a control group. The treatment consisted of Emotionally focused group therapy (EFT) that consisted of eight 90-min weekly group sessions in each session and control group did not receive any treatment. After treatment, both groups were completed questionnaires. The intervention was performed on the Clinical Psychology and Counseling Center at the Ferdowsi University of Mashhad (Iran). Inclusion criteria: ages less 40 years, suffered from type 2 diabetes, had Diabetes for at least two years. Exclusion criteria: had severe somatic illness and psychiatric disorder, had Gestational Diabetes Mellitus, to use psychiatric drugs. The treatment consisted of Emotionally focused group therapy (EFT). Primary outcome variables are emotional expressiveness and sexual function.
