Comparative study on the efficacy of symptomatic relaxation techniques, laryngeal manual therapy and combined method in voice therapy in teachers with muscle tension dysphonia

Protocol summary

Study aim

Comparative study on the efficacy of symptomatic relaxation techniques, laryngeal manual therapy and combined method in voice therapy in teachers with muscle tension dysphonia

Design

The design of the research is a randomized clinical trial.

Settings and conduct

The population studied in this study is the primary school teachers in Tehran city of who have an voice complaint. Therapeutic sessions will be hold at the private speech therapy clinic.

Participants/Inclusion and exclusion criteria

Teachers included who aged 25 to 50 years old and had no history of allergy, hearing loss, endocrine diseases, neurologic disorders, addiction, and voice therapy. They should have no catching colds and upper respiratory tract infection 1 month before initiation and duration the study. Moreover, they should not place in a menopause or menstrual period at the time of study. They excluded when they were not able to continue treatment protocols and lose any of above inclusion criteria.

Intervention groups

Teachers are randomly assigned to three groups, The first teacher who visits placed in symptomatic voice therapy, next in circumlaryngeal manual therapy, next placed in combined method

Main outcome variables

Voice handicap index; dysphonia severity index; perceptual auditory quality of voice; length of larynx; muscle tension; stroboscopic characteristic

Scientific title

Comparative study on the efficacy of symptomatic relaxation techniques, laryngeal manual therapy and combined method in voice therapy in teachers with

muscle tension dysphonia

Public title
The effect of voice therapy in improving voice quality in teachers

Purpose
Treatment

Inclusion/Exclusion criteria
Inclusion criteria:
Teachers included who aged 25 to 50 years old No history of allergy, hearing loss, endocrine diseases, neurologic disorders, addiction, and voice therapy. They should have no catching colds and upper respiratory tract infection 1 month before initiation and duration the study. No use of cigarettes, drugs and alcoholic beverages Having voice complaint that lasted more than 3 months Not participated in other voice therapy program Not having a history or presence of various diseases associated with the digestive system, with the exception of gastroesophageal reflux due to its relatively high prevalence Receive MTD diagnosis by ENT physician and speech and language pathology They should not place in a menopause or menstrual period at the time of study.
Exclusion criteria:
They excluded when they were not able to continue treatment protocols and lose any of above inclusion criteria.

Age
From **25 years** old to **50 years** old

Health conditions studied

1

Description of health condition studied
Muscle tension dysphonia
ICD-10 code
R49.8
ICD-10 code description
Other voice and resonance disorders

Primary outcomes

1

Description
Dysphonia severity index
Timepoint
Before, during and after treatment
Method of measurement
Acoustic analysis and formula calculation

2

Description
Grade of dysphonia
Timepoint
Before, during and after treatment
Method of measurement
Auditory perceptual judgments

3

Description
Voice handicap index
Timepoint
Before, during and after treatment
Method of measurement
Self-assessment questionnaire

4

Description
Repetition of vocal tract discomfort
Timepoint
Before and after treatment
Method of measurement
Self-assessment questionnaire

5

Description

Severity of vocal tract discomfort

Timepoint

Before and after treatment

Method of measurement

Self-assessment questionnaire

6

Description

Stroboscopic characteristic

Timepoint

Pre and post treatment

Method of measurement

Observation and perceptual judgment

7

Description

Pattern of muscle tension

Timepoint

Pre and post treatment

Method of measurement

Observation and perceptual judgment

8

Description

Muscle tension of larynx

Timepoint

Before, during and after treatment

Method of measurement

Palpation

9

Description

Length of larynx

Timepoint

Before, during and after treatment

Method of measurement

Palpatory

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: symptomatic voice therapy :One of the direct approaches is symptomatic voice therapy which proposed by Boone (1971) is based on the principles of behavior therapy. This approach uses a variety of voice facilitating techniques through direct modification respiratory and phonatory systems lead to improvement in symptoms of voice production on correction of voice production symptoms and manipulates voice characteristic. The treatment

techniques were presented for 10 individual sessions twice a week and each session lasted approximately 45 min

Category

Treatment - Other

2

Description

Intervention group: manual therapy: Physiologic voice therapy approach is another direct philosophy which recently has been considered in voice therapy of MTD aimed to directly alter or modify the physiology of the vocal mechanism. It seems laryngeal muscle tension imbalance is one possible physiologic cause of voice disturbances so laryngeal manual therapy can be noticed as a useful primary intervention in dysphonia, particularly MTD. In functional voice disorders muscle imbalance pressure, abnormal coordination patterns of muscles and intrinsic and extrinsic laryngeal muscles tension may change the cartilaginous structures and position of the larynx. Circumlaryngeal manual therapy proposed by Aronson is the first laryngeal manual therapy technique which has been gained more attention. The treatment techniques were presented for 10 individual sessions twice a week and each session lasted approximately 45 min.

Category

Treatment - Other

3

Description

Intervention group: combined method: Combined approaches combine one or more therapies to treat patients with voice impairment. The treatment techniques were presented for 10 individual sessions twice a week and each session lasted approximately 45 min

Category

Treatment - Other
