implement an interventional program for mental health in women with polycystic ovary syndrome

Protocol summary

Summary

Introduction: Polycystic ovary syndrome is the most common endocrine disorder in women of reproductive age. Promoting mental health of these women can improve the fertility and quality of life outcomes. Therefore, the purpose of this study was to implement an interventional program for mental health in women with PCOS. Materials and Methods: This is a clinical trial study. The researcher randomly assigned the research units into one of the two intervention or control groups and then designed the intervention on the intervention group and the results were collected by a 28-item general health questionnaire (GHQ-28) and compared to the control group. Discussion: It seems that the findings of this study are helpful in promoting the mental health of women with polycystic ovarian syndrome and improving the quality of life of these women in the community.
