Comparison of the Effectiveness of Upper Limb Exercise and Respirotary Training on Outcome of COPD Patients in Selected Medical Centers of Qazvin Science Medicine University.

Protocol summary

Study aim

The comparison of the effectiveness of upper limb exercise and respirotary training on outcome of COPD patients

Design

Eligible patients (according to the inclusion criteria), then the patient will choose 75 blocks of a trio of three groups: upper limb exercise, breathing exercises and group controlling in the following, we will create five modes: (Upper extremity exercise, breathing exercises, control) (Breathing exercises, upper extremity exercise, control) (Control, respiratory exercises, exercise upper limbs) (Breathing exercises, upper extremity exercise, control) (Upper extremity exercise, control, respiratory exercises) and then, based on the table of random numbers each of these groups will be selected; for example, if the number is one, the first will select the combination or if the number two will be selected and combined the two came to the patient's respiratory exercises for a group of up to 25, 25 of the patient for group exercise of limbs the patient's upper and 25 for the control group.

Settings and conduct

Group exercise upper limbs for a month, three times a week (12 sessions) for 30 minutes per session, which will be in the presence of the researcher in the Center province hospital rehab. The second group, respiratory group, exercises daily for a month at home for 20 minutes and four times a day (morning, afternoon, evening, night) and will do the proper pattern of patients one minute workout and two minute break will be given training exercises conducted daily by a researcher tracking has enhanced call up to four weeks

Participants/Inclusion and exclusion criteria

Inclusion criteria 1) All patients with copd referred to lung clinic of Qazvin Velayat Hospital with aged 30 to 90 years 2) Average and Sever COPD Diagnosis by a Physician and Refering to the Researcher in a Written Format. The exit criteria: 1) exacerbation in such a way that fails to participate in the exercises. 2) advanced cardiovascular disease. 3) catching a nerve disorder that is in conflict with the muscle-have exercises.

Intervention groups

1. Upper Limb Exercise Group 2. Respiratory Training Group 3. Control Group

Main outcome variables

Improve the health level of patients with COPD and help them to enjoy the higher quality of life and consequently leading to life satisfaction.

Health conditions studied

1

Description of health condition studied
Chronic Obstructive Pulmonary Disease

ICD-10 code
J44

ICD-10 code description
Other chronic obstructive pulmonary disease

Primary outcomes

1

Description
St. George's special quality of life questionnaire that is used for respiratory ailments. Rating of the questionnaire for every incumbent has from zero to 100, and the total inventory is defined in such a way that the number zero, indicates full health and gradually increase it to a lower quality of life.

Timepoint
measurement processes in this study would be at the beginning of the study, then after 30 days of

interventions and then the final measurement is done again.

Method of measurement

1. Demographic information form, 2. St. George's quality of life questionnaire 3. Performing 6-minute walk test 4. Self- reporting checklist 5. Upper extremity exercise checklist

Secondary outcomes

1

Description

6-minute walk test that documented in selected Medical Center (Velayat hospital) will be used. This form has 5 questions in the field of walking and finally the amount of mileage of the patient record.

Timepoint

Levels measured in this study was the first study in the first 30 days and then do the interventions are done, and then the final measurement is done again.

Method of measurement

The test would be carried out in Velayat Hospital (formerly in the Department of the Interior has been measuring men) within 6 minutes, will during the mileage rate and will be recorded by the researcher.

Intervention groups

1

Description

Intervention group: respiratory exercises on a regular basis that includes: a bud lips breathing and breathing is diaphragmy by three one-hour sessions on research during three consecutive days for a person and face to face training will be given to patients. After getting more information, respiratory exercises checklist to the target group will be given up to every day after doing exercises, in the appropriate section of mark. this group has 25 people and exercises daily for one month for 20 minutes and four times a day (morning, afternoon, evening, night) and patients will do a minute pattern of practice and two minute break will be given training exercises conducted daily tracking order by a researcher for the phone call up to four weeks. 2. upper extremity exercise group: 25 second sample in this group. After collecting the number of samples as previously mentioned research objectives with the briefing outlines and do the work for the patients of this group will be formed and after getting a written consent, completing a questionnaire, demographic information, St. George's quality of life questionnaire for all patients. 6-minute walk test in consecutive two days for this group such as the previous group will be conducted.

Category

Rehabilitation

2

Description

Control group: 25 patients will be put in the control group. Similar to the intervention group, after explaining the research goals for each patient after completing the consent form, the demographic questionnaire and the questionnaire of the quality of life of St. George and 6-minute walk compared to complete. The usual care control group will be placed to avoid ethical problems. After completion of the study, the results of research will also presented to the control group. In the event of any change in personal life and work or any important changes either good or bad, such as the loss of a job or members of the family and marriage that makes changing the quality of life, it would be stated to the researcher. It should be noted at the end of the study in each group to compare the results St. George's quality of life questionnaire for all samples would be tested and also completed 6 minute walk.
