The influence of education on anxiety and self-efficacy in mothers of children with surgery

Protocol summary

Study aim

Determining the effect of education on the anxiety and self-efficacy of mothers of pediatric patients with surgery

Design

In this study, 60 mothers who were surgically and randomly selected to enter the study were divided into two intervention and control groups and each participant was assigned a code.

Settings and conduct

The researcher explained the research objectives to the mothers of surgical children referring to Taleghani Hospital in Gorgan and a pre-test questionnaire for both groups. Then she was given control in the routine training group during admission and admission and before surgery. However, in the test group, along with routine tests, trained and scheduled training is provided for 10 to 15 minutes in each section. The questionnaires will be completed again before entering the operating room.

Participants/Inclusion and exclusion criteria

Criteria for entering this study (mothers who have undergone surgery for their first child Lack of history of abortion, ability to speak and understand Persian, ability to take care of oneself and child, lack of physical and psychological illness, reading and writing literacy and the child undergoing general surgery) and mothers whose children have Physical and psychological problems such as mental retardation, cerebral palsy and congenital defects were excluded from this study.

Intervention groups

Educating cognitive strategies for eliminating neurotic stress, overcoming anxiety, reducing anxiety and making peace and improving the efficiency of mothers of surgical children since the patient's arrival to the clinic and establishing a child's surgery that fully educates the careers before, during and after The child's practice involves answering questions and removing ambiguities for mothers

Main outcome variables

The amount of stress; the ability of mothers to manage stress; child care
