The comparison of dry needling and inhibitory Kinesio taping therapeutic effects in female patients with myofascial pain syndrome in upper trapezius muscle

Protocol summary

Study aim

The comparison of dry needling and inhibitory Kinesio taping therapeutic effects in female patients with myofascial pain syndrome in upper trapezius muscle

Design

Non-random (simple convenient method), without placebo control, single arm trial. The sample size of this study is 75 individuals: divided into 3 groups of 25 people.

Settings and conduct

Neuromuscular Rehabilitation Research Center Semnan University of Medical Sciences.

Participants/Inclusion and exclusion criteria

Women aged 20-40 years with upper myocardial infarction pain referring to Tabataba'i center in Semnan. Inclusion criteria: Having chronic pain that lasts at least 3 months from the start; the presence of the tight band in the muscle; having sensitive points in the upper trapezius muscle; recognizing pain. Exclusion criteria: Individuals with fibromyalgia; Individuals with facial nerve neuralgia, rheumatoid arthritis, rheumatic diseases, degenerative diseases, fractures, dislocation, inflammation, bursitis and arthritis; persons with neck and shoulder myopathy, neuropathy, myelopathy and cortical People with history of neck and shoulder surgery and other areas of the body; People with a history of injection in the trigger points of upper trapezius muscle or acupuncture; People with cancer, infection, pain and pathogenesis, acquired immunodeficiency virus; Athletes; people with substance abuse or taking corticosteroid drugs as well as pregnant women; those who have undergone continuous physiotherapy or exercise during the last two weeks; those who received dry needles in the last three months; taking sedative medications; Or alcohol one week prior to evaluation; people with mental and cognitive impairment and uncorrected vision impairment; people with acrylic skin

allergies.

Intervention groups

Control group: Only for comparison with intervention group, no treatment is performed. Intervention group 1: 25 patients will be treated with dry needles according to the protocol (sterile epoxy needles 0.3 mm in diameter and 5 cm in length). Each point will be treated for 2 minutes. Treatment is done every 72 hours for up to two weeks and the follow up is repeated after one week. Intervention group 2: 25 people are treated with an inhibitive movement tape according to the protocol (5 cm bandwidth). The muscle will be measured in its longitudinal position (the neck will bend to the opposite side and rotate to the same side). Treatment is done every 72 hours for up to two weeks and the follow up is repeated after one week.

Main outcome variables

Muscle thickness, Intensity of pain.
