The Investigation of the Effect of Mental Practice on Fear Of Falling during n Activity of Daily Living and Satisfaction in the Community-Dwelling Elderly

Protocol summary

Study aim

Determining the Effect of Mental Practice on Fear Of Falling during Activity of Daily Living in the Community-Dwelling Elderly. Determining the Effect of Mental Practice on satisfaction in the Community-Dwelling Elderly

Design

In this study, 40 Community-Dwelling elderly eligible based on inclusion criteria, referred to Yas Rehabilitation Center and Seyyed-Khandan cultural center in Tehran was selected. Participants were divided into two intervention and control group and a code was allocated to each participant.

Settings and conduct

This study is an experimental, randomized clinical trial in which Community-Dwelling elderly are selected and randomly assigned into two groups (control/ treatment). This study is designed as single-blind in which participants are not aware of being in control or intervention group.

Participants/Inclusion and exclusion criteria

score 21 or higher of MMSE; chronological age of 80-60 years; minimum score of 24 from the (FES-I); score less than 33 in the internal visual imagery subscale, less than 20 in the external visual imagery subscale, and less than 21 in the kinesthetic imagery subscale of the VMIQ-2 questionnaire; fear of falling in at least one of the activities listed in the SAFFE Test; absence of neurological diseases such as dementia, Alzheimer's, stroke, Parkinson's and MS that cause cognitive or balance impairment (confirmed by geriatric physician); absence of specific visual or hearing impairment, or being modifiable with adaptable equipment if present (based on medical records of the center); reading and writing skills; Not Using disruptive equilibrium drugs.

Intervention groups

The intervention group include 20 community-dwelling

elderly, who will receive mental practice with balance exercises. For the intervention group, mental practice in the presence of therapist for 15 minutes and balance exercises for both intervention and control groups will be performed for 30 minutes, 3 times per week and within 4 weeks. The control group include 20 community-dwelling elderly who will receive only balance exercises.

Main outcome variables

Fear of falling in the activity of daily living; satisfaction

Purpose

Treatment

Inclusion/Exclusion criteria**Inclusion criteria:**

Having a score 21 or higher from MMSE cognitive test being at the age of 80-60 years Having a minimum score of 24 from the Efficiency Scale, International Form (FES-I). Having a score less than 33 in the internal visual imagery subscale, less than 20 in the external visual imagery subscale , and less than 21 in the kinesthetic imagery subscale of the VMIQ-2 questionnaire. Having fear of falling at least in one of the activities listed in the SAFFE Test. absence of specific visual or hearing impairment , if present, being modifiable with adaptable equipment (based on medical records of the center). Reading and writing skills.

Exclusion criteria:

Using disruptive equilibrium drugs. Having neurological diseases such as dementia, Alzheimer's, stroke, Parkinson's and MS that causes cognitive or balance impairment (geriatric physician confirmation).

Health conditions studied**1****Description of health condition studied**

old age - fear of falling

ICD-10 code**ICD-10 code description****Primary outcomes****1****Description**

Score of fear of falling in activity of daily living in the Activities-specific Balance Confidence questionnaire

Timepoint

Measure fear of falling in activity of daily living at the beginning of the study (before the intervention) and 28 days (4 weeks) after the intervention.

Method of measurement

Activities-specific Balance Confidence questionnaire

2**Description**

Satisfaction in activity of daily living, the score derived from the Canadian Occupational Performance Measure.

Timepoint

Measuring satisfaction degree in activity of daily living at

the beginning of the study (before the intervention) and 28 days (4 weeks) after the intervention.

Method of measurement

Canadian Occupational Performance Measure Inventory

Secondary outcomes

1

Description

Balance Score in Berg Balance Scale and Functional Reach Test.

Timepoint

Measurement of balance at the beginning of the study (before the intervention) and 28 days (4 weeks) after the intervention.

Method of measurement

Berg Balance Scale and Functional Reach Test Questionnaire

2

Description

Functional mobility score in Time UP and GO test.

Timepoint

Measurement of functional mobility at the beginning of the study (before the intervention) and 28 days (4 weeks) after the intervention.

Method of measurement

Time UP and GO test to measure functional mobility.

Intervention groups

1

Description

Intervention group: First the researcher becomes familiar with the physical condition of the participants' home by observing the video which recorded by care giver and visiting their homes. This is done to increase the researchers awareness about the layout of the objects and the type of architecture of the home environment to facilitate the preparation and presentation of mental practice program specifically. According to SAFFE questionnaire, activities which participants have fear of falling facing them, will be selected and exercises will be provided in form of these activities and tailored to the circumstances of each participant's home. They will be asked to imagine their selected activities as kinetic imagery in their minds. Intervention takes place 3 days per week (Sunday, Tuesday, Thursday), which lasts for 4 weeks. Each treatment session will be held between 8 -12 in the morning. The participants will attend in a therapeutic program for intervention in a calm and well-prepared room. Each intervention session lasts 15 minutes. The first 5 minutes are relaxation exercises, such as breathing relaxation techniques to increase comfort and concentration of participants, as well as readiness for doing mental practice. The participant is placed on an appropriate bed and then closes his/her eyes. He/She is asked to think about the chosen activity based on the SAFFE questionnaire step by step with

researcher guidance. In the following, he/she is asked to try to do this with more speed and skill at any period of intervention sessions. Duration of mental practice is calculated by stopwatch. Additionally, the traditional rehabilitation program in the form of balance exercises will also be provided to the intervention group by written instructions and consultation for exercising at home. These exercises will be performed at home in form of activities of daily living to increase balance for 4 weeks, three days per week about half an hour a day. Every 4 sessions, home interventions will be monitored by researcher through a video check of each session recorded by caregivers.
