Comparison of postoperative analgesic effect of subcutaneous administration of tramadol or bupivacaine in the incision of cesarean section.

Protocol summary

Summary

The purpose of this study was to evaluate the effects of tramadol vs bupivacaine administration at wound closure on postoperative pain relief in patients undergoing cesarean section (CS). Sixty women undergoing cesarean deliveries were randomly assigned to receive either 10ml of bupivacaine 0.5% (n=30) or 50mg tramadol in 10ml normal saline (n=30) both as a local wound infiltration prior to skin closure at the end of operation. Postoperative pain is evaluated with a visual analogue scale (VAS: 0-10) at 1, 2 and 6 hours after operation. Time to first analgesic administration, analgesic consumption in the 24hours after operation is recorded and compared in two groups.

Scientific title

Comparison of postoperative analgesic effect of subcutaneous administration of tramadol or bupivacaine in the incision of cesarean section.

Public title

Comparison of postoperative analgesic effect of subcutaneous administration of two drugs in the incision of cesarean section.

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria :patients with term pregnancy and normal fetus ,in range of 18-35yr,60-90kg,and no underline disease who are candidate for cesarean section. Exclusion criteria:cardio-pulmonary disease, diabetes, hypertention, preeclampsia, previous history of addiction.

Age

From **18 years** old to **35 years** old

Gender

Female

Health conditions studied

1

Description of health condition studied
postoperative abdominal pain
ICD-10 code
R10.3
ICD-10 code description
Pain localized to other parts of lower abdomen

Primary outcomes

1

Description
postoperative pain
Timepoint
1,2 and 6 hours postoperatively
Method of measurement
visual analog pain score

Secondary outcomes

1

Description
the first request of the patient for analgesic
Timepoint
during 24 hours after operation
Method of measurement
in hours

2

Description
opioid consumption
Timepoint
during 24 hours after operation
Method of measurement
mg morphine

3

Description
Drug side effects
Timepoint
during 24 hours after the operation
Method of measurement
asking the patient

Intervention groups

1

Description
subcutaneous administration of 10ml of bupivacaine 0.5% as a local wound infiltration prior to skin closure at the end of operation
Category
Treatment - Drugs

2

Description
subcutaneous administration of 50mg tramadol in 10ml normal saline as a local wound infiltration prior to skin closure at the end of operation
Category
Treatment - Drugs
