Comparison of Single-incision laparoscopic cholecystectomy and mini-laparoscopic cholecystectomy in Shariati hospital between 2012 to 2014: A Randomized Clinical Trial Study

Protocol summary

Summary

The aim of this study is the comparison between mini-laparoscopic cholecystectomy (MLC) and single-incision laparoscopic cholecystectomy (SILC). This study is a randomized clinical trial conducted on the patients admitted to Shariati Hospital of Tehran that diagnosed with chronic cholecystitis, symptomatic cholelithiasis, with indications for laparoscopic cholecystectomy. The exclusion criteria included: ages more than 60, having CBD stone, obesity (BMI equal or more than 40), acute cholelithiasis, and previous surgeries in the upper abdominal areas. 40 patients with symptomatic cholelithiasis who met the criteria will be enrolled in the study. After obtaining informed consent, they will be randomly assigned to SILC or MLC (20 in each group). The duration of the surgery and the events occurring during the surgery will be registered. Also, the two groups will be compared in terms of levels of pain (with visual analog scale: VAS), hospitalization period, the postsurgical complications including wound infection, and postoperative nausea and vomiting.

Health conditions studied

1

Description of health condition studied

Calculus of gallbladder without cholecystitis

ICD-10 code

K80.2

ICD-10 code description

Any condition listed in K80.5 with cholangitis

Primary outcomes

1

Description

duration of durgery

Timepoint

from the time the skin was cut until the time it was closed.

Method of measurement

recorded by surgeon

Secondary outcomes

1

Description

pain after surgery

Timepoint

8, 16, and 24 hours after surgery

Method of measurement

measuring levels of pain using visual analog scale(VAS)

2

Description

Nausea and vomiting after surgery

Timepoint

in the first 24 hours after surgery

Method of measurement

subjective, recorded by observer from the questionnaire

3

Description

intraoperative complications

Timepoint

at the end of operation

Method of measurement

recorded by surgeon

4

Description

Medical complications after surgery: hypertension, ischemia or cardiac arrhythmia

Timepoint

at the time of discharge

Method of measurement

based on medical chart

5

Description

hernia at the site of incisions

Timepoint

12 months after after surgery

Method of measurement

clinical exam and imagings

6

Description

wound infection

Timepoint

up to 1 month after surgery

Method of measurement

office visits and medical charts

7**Description**

Postoperative narcotic usage for pain control

Timepoint

up to 48 hours after surgery

Method of measurement

recorded by nurse in the questionnaire

8**Description**

Total Length of wounds

Timepoint

at the end of operation

Method of measurement

ruler with one millimeter percision

Intervention groups**1****Description**

In the MLC group, a 10- millimeter port was placed in the lower area of the navel, a 2.7- millimeter port was placed in the epigastric region, a 2.7-millimeter port was placed 2 centimeters below the ribs, and another 2.7- millimeter port was placed in the lower right side of the anterior axillary line. A 10- millimeter camera was sent in from the first port and the grasper holding the fundus of the gallbladder was sent in through the last port. The gallbladder was then taken out from the 10- millimeter port. After the laparoscopic cholecystectomy, the patients underwent the recovery period of the operating room and were transferred to the ward. Paracetamol was used as the base pain reliever and was given to the patients for 48 hours, 1 gram every 8 hours. In case of severe pain, 25 grams of Pethidine was slowly injected into the vein.

Category

Treatment - Surgery

2**Description**

In the SLIC Group: the main port was placed in the lower area of the navel, and the graspers and camera was entered through same port and cholecystectomy was performed. Then, the gallbladder was taken out from the navel location. The fascia and skin will be closed at the site of navel.
