Effects of nicotine on visuospatial deficits in schizophrenia

Protocol summary

Summary

This trial is going to survey effect of nicotine on visuospatial cognition in schizophrenic patients. Forty five cigarette smoker patients are selected from Tabriz Razi hospital and randomly assigned into one of 3 equal groups. At the baseline, patients are tested by visuospatial memory test on admission; then they are grouped into 3 group on discharge. First group will be tested without any intervention and after smoking their cigarettes. Second group will be tested before smoking cigarette in the morning. Third group will be tested after administering 15 mg nicotine patches in the morning. Visuospatial cognition is measured as primary outcome.

Scientific title

Effects of nicotine on visuospatial deficits in schizophrenia

Public title

Effect of nicotine on cognition of schizophrenics

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: Age between 20 to 40 years, less than 2 years from the start of disease course, being able to cooperate testing
Exclusion criteria: Coexistence of another major psychopathology such as mood or cognitive disorders or mental retardation, Non smoker patients

Age

From **20 years** old to **40 years** old

Gender

Both

Phase

N/A

Groups that have been masked

No information

Sample size

Target sample size: **45**
