study of the effects of Aromatherapy with Rose and Lavender on the Quality of Sleep in patients after CABG in Dr. Heshmat Hospital in Rasht, 2017-2018

Protocol summary

Study aim

study of the effects of Aromatherapy with Rose and Lavender on the Quality of Sleep and Depression in patients after Coronary Artery Bypass Grafting

Design

Clinical trial study, Phase 2, randomized, triplicate and control group, each group of 34 patients was designed in the period of 2017-2018.

Settings and conduct

The statistical population is the patients after open heart surgery in the surgical wards of Heshmat Hospital in Rasht, Iran

Participants/Inclusion and exclusion criteria

The eligibility criteria included the following: age 65 years or less (based on the WHO age of 65 and older as an aging age, so as to ensure that the sense of aging is caused by aging), the patient's willingness to participate in the study, the lack of use Patients with anti-depressant drugs and narcotics, speeches of patients in Persian, having clear verbal ability, not having a history of known psychological disorders, having no history of allergic rhinitis and other respiratory and sinusitis problems, not having a history of effective systemic or chronic disease On the sense of smell or hearing and not having a history of sleep disorders and relying on non-use Eating drugs and hypnotics.

Intervention groups

The patients are randomly divided into 3 groups: the first group inhaled 2% lavender essence , the second group inhaled 2% rose essence, and the third group without any intervention.

Main outcome variables

Demographic information and sleep quality and Depression

Sample size

Target sample size: 34

Randomization (investigator's opinion)

Randomized

Randomization description

Since the nature of the interventions restricts the ability to run in a common room environment, it was decided that the rooms would randomly be randomized based on 6 random blocks and would be changed in three randomized rooms in order to eliminate potential confusion. In the eligible patients entered in each room, the intervention will be applied.

Blinding (investigator's opinion)

Title and more details about the data/document

Patients in the two groups of patients undergoing

lavender and flower mourning therapy are asked to inhale the lavender and flower of Mohammadi, which is as much as three drops, for 5 nights each night during the period from 21 to 23 Put on a piece of cloth attached to the patient pillow. It should be noted that during the intervention period, people who develop symptoms such as dyspnea or allergic symptoms will be excluded from the study. Monitor the patient in the department by the partner of the patient and the nurse. Then the sixth day of the questionnaire of sleep quality assessment is completed by the researcher. The researcher in the control group completes the sleep quality questionnaire without any intervention the morning of the day after entering the surgical department and the sixth day of the sleep quality questionnaire.

When the data will become available and for how long

Between 21:00 and 23:00

To whom data/document is available

For scholars working in academia and academia

Under which criteria data/document could be used

After collecting data, SPSS-V.21 software is used to describe the data. Descriptive statistics (percentage) and mean (standard deviation) will be used. The normal distribution of quantitative amounts based on the Kolmogrov-Smirnov test will be investigated. In order to compare the groups in terms of demographic characteristics, one-way analysis of variance (with Tukey's post hoc test) and Kruskal-Wallis test will be used if no normal distribution is made. In order to compare the groups in terms of qualitative demographic characteristics, the Chi-square test was used and for the qualitative variables of Kruskal-Wallis test (using the Man-Whitney post-mortem test along with the correction of Ben Freonny). To compare the mean sleep quality score in the three groups at the end of the intervention, the covariance analysis will be used by adjusting to the base sleep quality score and eliminating the effect of other adjuncts. In the absence of a condition for covariance analysis, stratified analysis will be used.
