Comparison of the effectiveness of two methods of motivational interviewing and use of peer group in promoting puberty health in adolescent girls

Protocol summary

Study aim

Comparison of the effectiveness of two methods of motivational interviewing and the use of peer group in improving the puberty health of adolescent girls

Design

Two intervention groups and one control group were designed parallel. The sample size is estimated at 100 people per group. Stratified random sampling is done.

Settings and conduct

All high schools of the first girth of Shahrood district are included in the study and are divided into intervention and control groups based on homogenization and then random selection. The analyst, and participants, have been blinded to this study.

Participants/Inclusion and exclusion criteria

Iranian nationality • Not having a specific disease that prevents from participating in the research • Lack of or history of diseases and mental disorders • No history of taking psychiatric drugs • Not having restricted attendance at meetings • Not attending similar classes outside of school • Not having a loved one's death or stressful events in the last 3 months • The desire of teenagers and parents to participate in the study and fill out an informed consent form by them

Intervention groups

In this study, there were 2 intervention groups (motivational interview and peer group) and 1 control group. The intervention group received one, five 60-minute sessions of motivational interviewing to improve the health of puberty. The intervention group is also trained by peers already trained. The control group does not have an educational intervention until the end of the intervention, but immediately after completing the intervention due to the ethical issues, they will hold educational sessions on puberty health.

Main outcome variables

puberty health

Randomization (investigator's opinion)

Randomized

Randomization description

Randomization is simple in the first step. Schools are non-profit based, located in the center of the city and in the margin of the city are divided into 3 classes or groups. The school is considered as a cluster on each floor. In each class, the school is randomized. Of any homogeneous group, schools are selected randomly. In each school, a class is randomly selected as a simple one. Sampling continues to the limit. Then, selected schools of each class are randomly selected and created in 3 groups: Group A, B, and C. After completing the pre-test, groups A, B, and C are randomly assigned to peer groups for control, motivational interviewing and training.

Blinding (investigator's opinion)

Single blinded

Blinding description

All the participants in the study announced that there are three groups and they are randomly assigned to a specific group. In order to prevent leakage of information from groups, there is only one group in each school (intervention 1, intervention 2 or control). Also, to blind the person collecting the information, another person who is not informed to the group is used to fill in the questionnaires after the intervention in two groups. Also, the person who analysis the data, does not know the

group of people.

puberty Health Questionnaire

Timepoint

Evaluation of puberty health before the intervention - immediately after the intervention and one month after the intervention was completed.

Method of measurement

puberty Health Questionnaire

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: To conduct motivational interviewing sessions to improve the puberty health of girls' at intervals of one week and 5 sessions 60 minutes. The day of the meetings is discussed with the participants beforehand and will be served after the meeting.

Category

Behavior

2

Description

Intervention Group 2: In this group, peer educators will be selected by students with conditions such as higher score in the puberty health questionnaire than others, approved by the school administrator and teachers. Elderly peers see a training session by the researcher on puberty health behaviors and then they will be given a pamphlet of the same material to remind them. Then, one session will be held to introduce peer educators to others and a brief explanation of their puberty health by the presence of a researcher in the classroom. Continuing education is informal and can provide training in any environment. 1 month is given to peer educators to transfer information to others.

Category

Behavior

3

Description

Control group: This group does not receive any counseling and training until the end of the interventions. However, in order to observe ethical issues after completing the interventions and completing post tests, two educational sessions will be held with the content of puberty health and to promote puberty health by the researcher for this group.
