

Clinical Trial Protocol

Iranian Registry of Clinical Trials

02 Jun 2026

The comparison of the immediate effect of athletic taping and kinesiotope techniques on functional performance tests of female athletes with chronic ankle instability

Protocol summary

Study aim

To investigate the immediate effects of different types of tape (Kinesiotaping®, athletic taping) on functional performance in athletes with chronic ankle instability.

Design

A clinical trial with a control group, with crossover groups of 16 patients, not blinded, randomized with taking concealed envelop from inside of a bag.

Settings and conduct

Each participant receives all interventions with a different sequence in 5 sessions with intervals and acts as her control group. (For example, participant1; in session1: kinesiotope, 3 days later in session 2: athletic tape, 3 days later in session 3: Kinesio-placebo taping and 3 days later in session 4: Placebo athletic taping and 3 days later in session5: without tape). The order of the sequence of interventions and the performance tests are determined for each participant separately and randomly (taking a sealed envelope from within the bag). The first selection of samples for taking part in the study will be performed by convenience sampling from athletic clubs in the academic and non-academic areas of Tehran province. Then all functional tests for all participants will be performed in 5 different conditions in 5 separate days in random order from 3-4 days.

Participants/Inclusion and exclusion criteria

Inclusion criteria: female athletes between 18 to 45; at least three ankle sprains during the past year; score of ≤ 24 on the Cumberland Ankle Instability Tools (CAIT)
Exclusion criteria: fracture or any acute ankle sprain in last three months; CAI in both side; pregnancy; neurological or vestibular disorder; anterior cruciate ligament injury; participated in a rehabilitation program.

Intervention groups

Kinesiotope; Athletic taping; Placebo kinesiotope; Placebo athletic taping; Without taping.

Main outcome variables

Modified Star Excursion Test; Hoping Test designed by Amanda; Figure-8 Hoping Test; Vertical Jump test

Scientific title
The comparison of the immediate effect of athletic taping and kinesiotaping techniques on functional performance tests of female athletes with chronic ankle instability

Public title
The comparison of the immediate effect of athletic taping and kinesiotaping techniques on functional performance of athletes with chronic ankle instability

Purpose
Supportive

Inclusion/Exclusion criteria
Inclusion criteria:
At least three ankle sprain during last year Scor of ≤ 24 of on the Cumberland Ankle Instability Tools (CAIT) Age between 18 to 45
Exclusion criteria:
Fracture Acute ankle sprain Chronic ankle instability in both side Pregnancy Neurological or vestibular problem Anterior cruciate ligament injury Participation in rehabilitation program

Age
From **18 years** old to **45 years** old

Gender
Female

Phase
N/A

Groups that have been masked

- Data analyser

Sample size
Target sample size: **16**

Randomization (investigator's opinion)
Randomized

Randomization description
The ordering of interventions and performance tests in each session is performed randomly and it is determined by removing the sealed envelope from within a bag.

Blinding (investigator's opinion)
Not blinded

Blinding description

Placebo
Not used

Assignment
Crossover

Other design features
All participants receive all interventions alternately with different sequences in 5 sessions.

Health conditions studied

1

Description of health condition studied

Chronic ankle instability

ICD-10 code

M24.2

ICD-10 code description

Disorder of ligament

Primary outcomes

1

Description

Modified Star Excursion Test

Timepoint

Measure in all sessions with intervals of three to four days

Method of measurement

Tape meter (centimeters)

2

Description

Hopping Test: this test was designed by Amanda et al. to evaluate agility and control movement of a limb on unstable surfaces.

Timepoint

Measure in all sessions with intervals of three to four days

Method of measurement

Chronometer

3

Description

Figure-8 Hopping Test

Timepoint

Measure in all sessions with intervals of three to four days

Method of measurement

Chronometer

4

Description

Vertical Jump

Timepoint

Measure in all sessions with intervals of three to four days

Method of measurement

Tape meter

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: siotaping® Method: This method is based on taping used for lateral ankle sprain. The foot is placed in a comfortable resting position with slight plantar flexion and the first I-strip is applied from middle of foot to just below the tibial tuberosity along muscle Anterior Tibialis. The second Y-strip is originated just above medial malleolus and passed under the heel and ended at fibular head point just near the insertion of first strip. The third one is placed on anterior side of ankle joint between medial and lateral malleolus. The last strip, is stretched under the foot, 6 inches above medial and lateral malleolus. All strips are stretched to approximately 100% of their resting length.

Category

Rehabilitation

2

Description

Intervention group: Athletic taping Method: In this method, first we fasten pre-wrap on the target joint (ankle). Then, we use two pieces of 5 cm width tape and implement them on the beginning and the end of pre-wrap as the anchors. Third, we implement one strip from medial to lateral crossing under the heel, and the other strip from medial to lateral crossing behind the heel in order to support the ankle. Finally, medial and lateral heel locks techniques are used.

Category

Rehabilitation

3

Description

Intervention group: Placebo-Kinesio taping: This method of taping is almost the same as the Kinesio taping, but we don't allow any tension along the tape.

Category

Rehabilitation

4

Description

Intervention group: Placebo-athletic taping: This method of taping is almost the same as the athletic taping method, but there is no structural correction in the ankle joint.

Category

Rehabilitation

5

Description

Control group: with out taping

Title and more details about the data/document

The results of primary outcomes will be shared.

When the data will become available and for how long

The start of the access period will be two months after the publication of the results.

To whom data/document is available

Data will be available to academic researchers.

Under which criteria data/document could be used

Once accessed, individuals have the right to use the study protocol for rehabilitation purposes.

From where data/document is obtainable

Marjan Askari will be responsive through email.

askari.marjan@gmail.com m_askari@sum

What processes are involved for a request to access data/document

After receiving the request and mentioning the reasons for the request, the data will be answered within a maximum of one month.
