

Clinical Trial Protocol

Iranian Registry of Clinical Trials

17 Jun 2026

The effect of cognitive rehabilitation based on information processing speed on occupational performance in people with Multiple Sclerosis (MS)

Protocol summary

Study aim

The effect of cognitive rehabilitation based on information processing speed on balance and mobility in people with Multiple Sclerosis (MS)

Design

Clinical trial with control group, randomized, single blinded, with 70 patients

Settings and conduct

The intervention group will receive a cognitive rehabilitation program in Rofeideh Hospital. They will also receive common therapies of occupational therapy that include flexibility and balance exercises. The control group will receive common therapies of occupational therapy that include flexibility and balance exercises in Sina Hospital. Also, the intervention will be explained to all patients, but will not be mentioned the impact of intervention on evaluation tests and mobility and balance.

Participants/Inclusion and exclusion criteria

The person would be willing to participate in the research! The person has a definite diagnosis of MS by a specialist! The person has an EDSS score of 5 down! The person has a FSS score of 9-35! The person can work with the computer! The person has no other neurological diseases! The person has not taken corticosteroids 28 days before the intervention! The person has no psychological disorders.

Intervention groups

The intervention group will receive a cognitive rehabilitation program based on the information processing speed through the Can Tab system for 12 sessions. They will also receive common therapies of occupational therapy that include flexibility and balance exercises. The control group will receive common therapies of occupational therapy that include include flexibility and balance exercises for 12 sessions.

Main outcome variables

Balance score in the Balance Evaluation System Test

Scientific title

The effect of cognitive rehabilitation based on information processing speed on occupational performance in people with Multiple Sclerosis (MS)

Public title

The effect of cognitive rehabilitation based on information processing speed on occupational performance in people with Multiple Sclerosis

Purpose

Supportive

Inclusion/Exclusion criteria

Inclusion criteria:

The person would be willing to participate in the research. The person has a definite diagnosis of MS by a specialist. The person has an EDSS score of 5 down. The person has a FSS score of 9-35. The person can work with the computer. The person has no other neurological diseases. The person has not taken corticosteroids 28 days before the intervention. The person has no psychological disorders. The age of the person is 20 to 60 years. Gender of patients has no limit.

Exclusion criteria:

Age

From **20 years** old to **60 years** old

Gender

Both

Phase

N/A

Groups that have been masked

- Participant

Sample size

Target sample size: **70**

Randomization (investigator's opinion)

Randomized

Randomization description

Patients in two Rofaydeh and Sina centers are randomly divided into control and intervention groups (refer odd days to Sina hospital for control group and refer even days to Rofaydeh hospital for intervention group). This division was done by draw with cup.

Blinding (investigator's opinion)

Single blinded

Blinding description

After receiving consent from patients, the way of intervention will be explained to them. But the impact of intervention on evaluation tests and mobility and balance will not be mentioned.

Primary outcomes

1

Description

Balance score in the Balance Evaluation System Test

Timepoint

The balance will be evaluated before the beginning intervention, after the end of intervention and two months after the end of intervention.

Method of measurement

The Balance Evaluation System Test

Secondary outcomes

1

Description

The information processing speed score in Paced Auditory Serial Addition Test (PASAT)

Timepoint

The information processing speed will be evaluated before the beginning intervention, after the end of intervention and two months after the end of intervention.

Method of measurement

The Paced Auditory Serial Addition Test

2

Description

The information processing speed score in the Symbol Digit Modalities Test (SDMT)

Timepoint

The information processing speed will be evaluated before the beginning intervention, after the end of intervention and two months after the end of intervention.

Method of measurement

The Symbol Digit Modalities Test (SDMT)

Intervention groups

1

Description

Intervention group: The intervention group will receive a cognitive rehabilitation program based on the information processing speed through the Can Tab system for 12 sessions. They will also receive common therapies of occupational therapy that include flexibility and balance exercises.

Category

Rehabilitation

2

Description

Control group: The control group will receive common therapies of occupational therapy that include flexibility and balance exercises for 12 sessions.
