Investigating the effectiveness of Rosemary ointment on Improving of pressure ulcer stage 1 in hospitalized patient of Intensive care unit

Protocol summary

Study aim

Investigating the effect of Rosemary topical ointment on bedsore grade I in hospitalized patient in ICU of Ali-ebn-abitalib hospital; 2018

Design

Clinical trial with control group, Community based and pragmatic, with parallel groups, blinded postoperative care, randomized

Settings and conduct

In this study, the effect of rosemary ointment on the size of the patient's pressure ulcer in the intensive care unit was investigated. In this study, the evaluator did not know how to grouping.

Participants/Inclusion and exclusion criteria

Age over 20 years Lack of diabetes No use of corticosteroids Patients are motionless Patients have moderate to severe decrease levels of consciousness

Intervention groups

Intervention group: Application of rosemary ointment
Control group: No application of Rosemary ointment

Main outcome variables

pressure ulcer size

Scientific title

Investigating the effectiveness of Rosemary ointment on Improving of pressure ulcer stage 1 in hospitalized patient of Intensive care unit

Public title

Investigating the effect of Rosemary ointment on bedsore grade 1

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Age over 40 years The absence of skin disorders such as dermatitis Moderate and severe alertness

Exclusion criteria:

Discharge with personal consent Failure to cooperate for any reason during the study Progress towards pressure

ulcer stage 2
Age
From **20 years** old to **90 years** old
Gender
Both

Phase
0

Groups that have been masked

- Participant
- Outcome assessor
- Data analyser
- Data and Safety Monitoring Board

Sample size

Target sample size: **70**

Randomization (investigator's opinion)

Randomized

Randomization description

The intervention group was recruited from the patients admitted to the intensive care unit with pressure ulcer stage I, in a sample size (n=35) in convenience method. Then, they will be classified according to the Body mass index (equal and less than 25 and above 25) and the age (20-40 years, 41-60 years, 61-90 years). The control group according to the Body mass index and age classification of the intervention group, was selected from among the patients admitted to the intensive care unit with the pressure ulcer stage I with convenience method.

Blinding (investigator's opinion)

Single blinded

Blinding description

In this study, the evaluator of bed sore size is not aware of patient grouping.

Intervention groups

1

Description

Intervention group: In this study, the length and width of the pressure ulcer will be measured first by the ruler. Then, the wound is wiped with 100 cc normal saline solution, 0.9% sterile non-injectable. After drying with sterilized gauze, the Rosemary ointment 30 grams made by Iranian GOLDARU Company (Isfahan, Iran), with a thickness of 2-3 mm, is placed on a 8-layer sterile gauze. Then, the ointment impregnated gauze is placed on a pressure ulcer and glued to the healthy skin with a paper anti-allergenic adhesive. This process takes place once a day for 7 days. On the third and seventh day after the application of the ointment, the extent of the wound will be measured with the same ruler. The size of the wound will be classified using the pressure ulcer scale for healing tool (PUSH) from 0 to 10. Zero means no wound, and number 10 means a wound with more than 24 Square centimeters. Finally, the three scores of different stages of measurement, will be compared.
