Effect of different doses of Heparin in prophylaxis of Deep vein Thrombosis following laparoscopic bariatric surgery ; A Randomized Clinical Trial

Protocol summary

Summary

In this study different doses of Heparin in prophylaxis of Deep Vein Thrombosis following laparoscopic bariatric surgery will be compared. Pre-operative information will be gathered and baseline assessment will be done in obesity patients who have laparoscopic bariatric surgery and accept the invitation to participate in this study. Those patients who do not show any sign of thrombosis in their first doppler ultrasound, will be allocated into the study groups (group 1 and group 2). Each of the groups 1 and 2 consists of 350 patients which will receive 10000 units and 15000 units Heparin for 14 days, respectively. Color Doppler sonography assessment will be done in order to diagnose femoral, popliteal, and calf vein deep veins thrombosis (DVT). Color Doppler assessment will be performed pre operatively and on the second and tenth post operative days and the results will be recorded in relevant Case Report Forms (patients booklets). After discharge, patients will be followed by the corresponding researcher and information on occurrence of DVT will be documented. The results will be compared in the two groups.

Scientific title

Effect of different doses of Heparin in prophylaxis of Deep vein Thrombosis following laparoscopic bariatric surgery ; A Randomized Clinical Trial

Public title

Effect of different doses of Heparin in prophylaxis of Deep vein Thrombosis following laparoscopic bariatric surgery

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria :Obesity patients who have laparoscopic

bariatric surgery Exclusion criteria: Patients who have positive result of clots in first Doppler ultrasound

Age

No age limit

Gender

Both

Phase

N/A

Groups that have been masked

No information

Sample size

Target sample size: 700

Randomization (investigator's opinion)

Randomized
