The Comparison of the effects of virtual-reality training and traditional balance training on the balance of the elderly: a randomized trial

Protocol summary

Study aim

This study aims to compare the effects of two programs of virtual reality training and traditional balance training on the balance of elderly people.

Design

The present study will be conducted on 36 elders (men and women) who are living in Nursing homes. Participants will be randomly divided into three groups: An intervention group (N=12) that performs virtual reality exercises (VR), another intervention group (N=12) that will receive traditional balance exercises, and a control group (N=12) that would receive no intervention.

Settings and conduct

Each group participated in a 60-minute session, 3 times per week, for 9 weeks. The control group did not receive any intervention. To assess the participants' balance, the balance tests were used on one leg stance (OLS) with open and closed eyes, Functional reach test (FRT), Timed up and go Test (TUG), and Fullerton Advance Balance Scale (FABS).

Participants/Inclusion and exclusion criteria

Inclusion criteria were as follows: 1) Receiving the consent of the elderly to participate in the study; 2) The age range between 60-75 years; 3) Able to stand independently for 90 seconds; 4) Not having a history of lower extremity fractures in the past two years. Participants with: 1) Impaired cognitive status (Mini-Mental State Examination score <24); 2) Serious visual or hearing impairment; or 3) Neurological diseases were excluded from the study.

Intervention groups

Intervention group one (virtual reality training),
Intervention group two (traditional balance training) and control group

Scientific title

The Comparison of the effects of virtual-reality training and traditional balance training on the balance of the elderly: a randomized trial

Public title

Effects of virtual-reality training on balance

Purpose

Supportive

Inclusion/Exclusion criteria

Inclusion criteria:

Receiving the consent of the elderly to participate in the study
The age range between 60-75 years
Able to stand independently for 90 seconds
Not having a history of lower extremity fractures in the past two years

Exclusion criteria:

Impaired cognitive status (Mini-Mental State Examination score <24)
Serious visual or hearing impairment
Neurological diseases were excluded from the study

Age

From **60 years** old to **75 years** old

Gender

Both

Phase

Health conditions studied

1

Description of health condition studied

balance

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description

Balance is the ability to maintain the body's center of mass over its base of support.

Timepoint

One week before and after carrying out training interventions

Method of measurement

To assess the participants' balance, the balance tests were used on one leg stance (OLS) with open and closed eyes, Functional reach test (FRT), Timed up and go Test (TUG), and Fullerton Advance Balance Scale (FABS).

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: As an alternative to traditional balance training, balance exercises based on virtual reality (VR); that simulates an activity technology, has been proposed to advancement motor learning and transfer to factual world tasks. (Virtual Reality Training) performed training sessions using the Xbox Kinect, which includes Kinect and Console Sensors. The sensor was an infrared camera that diagnosed the position and movements of the player without the need for a specific controller and controlled the various games by the participant.

Category

Rehabilitation

2

Description

Intervention group: traditional balance training), includes training with the reduced Supporting surface, Close eyes, increase speed of movement, and adding proper movements.

Category

Rehabilitation

3

Description

Control group: during this period of the control group were asked to perform routine daily activities and not participate in specific exercises. So from the control group, in order, the effect of exercises and daily activities probabilistic on the participants' balance was used.

Title and more details about the data/document

The only part of the information, such as information on the main outcomes or the like, can be shared.

When the data will become available and for how long

Start the access period 6 month after the publication of the research results in a scientific journal

To whom data/document is available

Data will be available to all scientific researchers

Under which criteria data/document could be used

Only to help scientific research and with the written permission of the researcher can be used

From where data/document is obtainable

To receive data/document via email and phone, contact the researcher

What processes are involved for a request to access data/document

Data/document is provided by email to other investigators
