A comparative study of the efficacy of topical metformin cream versus placebo in the treatment of melisma

Protocol summary

Study aim

A comparative study of the efficacy of topical metformin cream versus placebo in the treatment of melisma

Design

In a four-phase clinical trial, 60 patients with melisma were studied in either the 15% metformin group or the placebo group. Patients were not aware of the type of drug. Also, the analyst did not know the type of drug

Settings and conduct

In a four-phase clinical trial, 60 patients with melisma referred to Dermatology Clinic of Ahvaz Imam Khomeini Hospital were studied in either the 15% metformin group or the placebo group. Medication or placebo was taken twice a day for three months. Patients were monitored on a monthly basis and MASI score was calculated and photographed before and at each visit.

Participants/Inclusion and exclusion criteria

Inclusion criteria: All patients with melisma referred to Dermatology Clinic of Ahvaz Imam Khomeini Hospital
Exclusion criteria: Patients who do not wish to continue treatment

Intervention groups

Intervention group: The 15% metformin cream was used twice a day for three months
Control group: Placebo was used twice a day for three months

Main outcome variables

Improvement of MASI score
