Effectiveness of Mindfulness-Integrated Cognitive Behaviour Therapy and Schema Therapy on the Emotional States and the Quality of life of People with Multiple Sclerosis

Protocol summary

Study aim

Effectiveness of Mindfulness-Integrated Cognitive Behavior Therapy and Schema Therapy on the Emotional States (Depression, anxiety, stress) and the Quality of life of People with Multiple Sclerosis.

Design

The sample consisted of 45 patients with MS. At first, the sample of this study was considered for each group of 20. MiCBT intervention was applied based on the protocol developed by Cayon (2011) at nine sessions (2 hours) in , as well as ST was applied based on the protocol developed by Jeffrey Young (2003) at 12 sessions (2 hours), and no intervention was presented in the control group. These psychological interventions were considered as independent variables and emotional states, and quality of life of patients with ms as dependent variables.

Settings and conduct

at first, we referred to MS society of Kerman. MS patients were invited to participate in this intervention by calling and informing them in person. Then, among those who enrolled, some that had criteria to entry into the research were informed to be present at intervention. They were randomly assigned into two experimental groups: micbt, ST and one control group.

Participants/Inclusion and exclusion criteria

being patient based on Neurologist diagnosis no addiction Non-use of psychiatric medication simultaneously with the intervention Not using other psychological treatments simultaneously

Intervention groups

This study was applied on two experimental groups and one control group, each group was include of 20 people with multiple sclerosis. Psychological intervention was applied on two levels: level 1 MiCBT and Level 2, ST, and the control group did not receive any therapeutic intervention.

Main outcome variables

improving depression, anxiety and stress of MS patients
Improving the quality of life of MS patients
Evaluating the effectiveness of MiCBT and ST therapy on emotional states and quality of life in MS patients

Symptoms and signs involving emotional state

Primary outcomes

1

Description

Emotional states that include depression, anxiety and stress are measured by the scale of depression, anxiety and stress (DASS-21). And they can be mild, moderate, and severe.

Timepoint

The emotional states were measured once before the intervention in the first session (pre-test) and one time at the end of the intervention in the final session (post-test).

Method of measurement

The DASS-21 scale was used to measure emotional states, which has 21 questions with Likert scale and has a good validity and reliability.

2

Description

Quality of life of MS patients measured by MS-QOL scale. And the 3 overall scales includes physical health, health and quality of life.

Timepoint

The Quality of life was measured once before the intervention in the first session (pre-test) and one time at the end of the intervention in the final session (post-test).

Method of measurement

The quality of life of MS patients was measured by MS-QOL scale, which is specific to assessing the quality of life of these patients. This scale has 54 questions for assessing 14 areas related to physical health and mental health, and its validity and reliability are confirmed by studies.
