

Clinical Trial Protocol

Iranian Registry of Clinical Trials

16 Sep 2026

The effect of oral capsule curcumin and vitamin E in comparison to placebo on serum levels of some antioxidants and inflammatory factors in postmenopausal women: A randomized, triple-controlled clinical trial.

Protocol summary

Study aim

Determination of the effect of curcumin and vitamin E in comparison with placebo on serum levels of some antioxidants and inflammatory factors in postmenopausal women

Design

En Randomized controlled clinical trial with three parallel arms.

Settings and conduct

This is a randomized, triplicate randomized controlled triplicate study on 93 postmenopausal women in Tabriz. Sampling in three different health centers will be done in terms of socioeconomic status. At before the intervention and after the intervention, after about 12 hours of fasting in the laboratory, the researcher 5 cc blood was taken and in three separate tubes with 3000 rpm in a minute for centrifugation at -70 ° C Centimeters will be kept until the tests are performed, the second time after the intervention, and the Total Antioxidant Capacity TAC, MDA, high sensitivity (hsCRP C-Reactive Protein), TNF- α (Tumor Necrosis Factor. Contributors will be assigned randomized blocking with a 1: 1: 1 assignment ratio to three groups (two intervention groups and one control group).

Participants/Inclusion and exclusion criteria

Participants in postmenopausal women aged 40 to 60 years who score at least 15 and a maximum of 42 in the Green Questionnaire have hot flash symptoms.

Intervention groups

The first intervention group received 500 mg capsicum capsules twice daily for up to eight weeks, the second intervention group received 200 IU of oral Capsules twice daily for eight weeks, and the third group receiving the control group will receive a placebo.

Main outcome variables

1) Mean serum levels of MDA and TAC in postmenopausal women 2) Mean serum levels of hsCRP

and TNF- α levels in postmenopausal women 3) Mean score of menopausal symptoms and its subtypes in postmenopausal women

General information

Reason for update

Greetings and Regards Correction of recruitment start date, recruitment end date, and completion of trial. Request the removal of tumor necrosis factor due to the very high cost of this kit (more than the total budget of the project) and the addition of renal and liver function, lipid profile and fasting blood sugar tests with lower cost as a secondary outcome. Serum samples have been frozen at -70 and are ready for testing.

Scientific title

The effect of oral capsule curcumin and vitamin E in comparison to placebo on serum levels of some antioxidants and inflammatory factors in postmenopausal women: A randomized, triple-controlled clinical trial.

Public title

The effect of oral capsule curcumin and vitamin E in comparison to placebo on serum levels of some antioxidants and inflammatory factors in postmenopausal women: A randomized, triple-controlled clinical trial.

Purpose

Treatment

Inclusion/Exclusion criteria**Inclusion criteria:**

1) Readiness to participate in the study 2) Having sufficient literacy to complete the questionnaire or the presence of a literate person in the family 3) has normal menopause 4) Women who are less than 6 years old from their menopause. 5) having at least 40 years and a maximum of 60 6) Earn a minimum score of 15 and a maximum of 42 in the Green Assessment Hot flashes

Exclusion criteria:

1) Use of tobacco and alcohol and herbal medicines 2) Stress factors such as the death of first-degree relatives in the last 6 months and the loss of a job 3) Any acute and chronic inflammatory disease (including uncontrolled diabetes, rheumatoid arthritis) and infections in the body 4) The presence of malignant disease 5) History of recent surgery and trauma 6) History of allergy to turmeric or other drugs, food and color. 7) taking anticoagulants (heparin, varfarin, enoxaparin) 8) Take vitamin E supplementation, curcumin or estrogen therapy for 3 months prior to study 9) Use of special diets

Age

Actual sample size reached: **84**

Randomization (investigator's opinion)

Randomized

Randomization description

Participants will be assigned randomly blocked blocks with 6 and 9 blocks and 1: 1: 1 assignment to three groups (two intervention groups and one control group) using RAS software.

Blinding (investigator's opinion)

Triple blinded

Blinding description

To hide the allocation, the same black, opaque, and back-numbered glasses (assignment sequences) inside them, either the curcumin capsule or the vitamin E capsule or the placebo capsule, will be used to hide the allocation. Preparation of glasses by an unoccupied person will be done in sampling and collecting data and analyzing them according to the assignment sequence. The first person will be in the condition of glass No. 1 and will continue until the sampling is completed. In all three groups, stratification based on BMI will be done alik

Health conditions studied**1****Description of health condition studied**

TAC (Total Antioxidant Capacity)

ICD-10 code
ICD-10 code description

2

Description of health condition studied
(Malondialdehyde) MDA

ICD-10 code
ICD-10 code description

3

Description of health condition studied
hsCRP (high sensitivity C-Reactive Protein)

ICD-10 code
ICD-10 code description

4

Description of health condition studied
Early symptoms of menopause

ICD-10 code
ICD-10 code description

Primary outcomes

1

Description
(Total Antioxidant Capacity) TAC

Timepoint
Before intervention and 8 weeks after intervention

Method of measurement
TAC levels will be measured with the Biorex kit.

2

Description
(Malondialdehyde) MDA

Timepoint
Before intervention and 8 weeks after intervention

Method of measurement
Spectrophotometric and Atomic Absorption Comparison (AAS) will be measured.

3

Description
hsCRP (high sensitivity C-Reactive Protein)

Timepoint
Before intervention and 8 weeks after intervention

Method of measurement
A turbidometric method based on the formation of a complex resulting from the reaction between hs-CRP and its specific antiserum will be measured.

4

Description
Score of Menopause symptoms and its sub-scales.

Timepoint
Before intervention and 8 weeks after intervention

Method of measurement

Green Questionnaire

Secondary outcomes

1

Description
Food intake

Timepoint
Before the intervention, one month after the intervention and at the end of the intervention

Method of measurement
24-hour Food record

2

Description
Renal function tests

Timepoint
Before intervention and 8 weeks after intervention

Method of measurement
Using biochemical methods

3

Description
Liver function tests

Timepoint
Before intervention and 8 weeks after intervention

Method of measurement
Using biochemical methods

4

Description
Serum lipid profile

Timepoint
Before intervention and 8 weeks after intervention

Method of measurement
Using biochemical methods

5

Description
Fasting blood sugar

Timepoint
Before intervention and 8 weeks after intervention

Method of measurement
Using biochemical methods

Intervention groups

1

Description
Intervention group: The first Intervention group will receive oral capsules of curcumin twice a day at a dose of 500 milligrams for eight weeks

Category
Treatment - Drugs

2

Description

Intervention group: The second intervention group will receive oral Capsule Vitamin E 200 IU twice a day for eight weeks.

Category

Treatment - Drugs

3

Description

Control group: The control group will receive placebo capsules twice a day for 8 weeks

Category

Placebo
