Comparison of the effect and Complications of Failure to do Plasmapheresis Versus Routine Plasmapheresis in Patients with Myasthenia Gravis Candidate for Thymectomy

Protocol summary

Study aim

Comparison of the Effect of Complications of Failure to do Plasmapheresis Versus Routine Plasmapheresis in Patients with Myasthenia Gravis Candidate for Thymectomy

Design

randomization is not done. this study is single blinded with historical controls that analyzer is blinded and conducted in 80 participants and including two groups of intervention (not perform Plasmapheresis group) and control (Plasmapheresis group) groups

Settings and conduct

In this study myasthenia gravis patients which have inclusion criteria are enrolled to the study and they are undergoing thymectomy with the open method or thoracoscopic and the results is compared to control group that went under Plasmapheresis before surgery.

Participants/Inclusion and exclusion criteria

Inclusion criteria: All members of the ossermanI, IIA and IIB groups who are candidate for thymectomy Exclusion criteria: Need to plasmapheresis before the surgery Patient dissatisfaction to entering the study

Intervention groups

Intervention group is the Patients with Myasthenia Gravis Candidate for Thymectomy that receive Failure to do Plasmapheresis intervention control group is the Patients with Myasthenia Gravis Candidate for Thymectomy that receive Plasmapheresis intervention

Main outcome variables

Blood volume, Duration of admission in ICU, Duration of admission in the ward

Myasthenia gravis

Primary outcomes

1

Description

Blood volume

Timepoint

after surgery

Method of measurement

Collecting the amount of blood in the surgery

2

Description

Duration of admission in ICU

Timepoint

after surgery

Method of measurement

Total number of days hospitalized

3

Description

Duration of admission in the bard

Timepoint

after surgery

Method of measurement

Total number of days hospitalized

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: Failure to perform plasmapheresis which is a plasma extraction technique that allows for the removal of immunoglobulins and pro-inflammatory factors, such as cryoglobulins and lipoproteins, which are the cause of many diseases. The amount and frequency of plasma required in this situation are partly optional. extracted plasma is replaced with albumin and saline and It is estimated that 2 liters of plasma replacement will remove 80% of circulating antibodies, which will

reduce acetylcholine antibody levels within 3-5 days.

Title and more details about the data/document

All data can be shared after patients are made unidentifiable.

When the data will become available and for how long

Data can be accessible 6 months after results are published

To whom data/document is available

Data will be available for researchers in universities and other scientific institutes

Under which criteria data/document could be used

Carrying out analysis on data is permitted.

From where data/document is obtainable

Data can be accessible through sending an email to the corresponding author

What processes are involved for a request to access data/document

After sending a request email to the corresponding author, data will be sent in 1 month
