

Clinical Trial Protocol

Iranian Registry of Clinical Trials

02 Jul 2026

The effect of emotional regulation training on the relationship between mothers and attention-deficit hyperactivity disorder

Protocol summary

Study aim

Determining the effect of emotional regulation training on the relationship between mothers and attention-deficit hyperactive disorder

Design

Clinical practice, pre-test and post-test plan, case and control group, 40 people in each group randomly

Settings and conduct

After obtaining informed consent from mothers who referred to welfare centers and explaining the research goals, mother_child relationship evaluation questionnaire will be completed in both the intervention and control groups, and then the intervention group will be trained emotion regulation based on the Grass model, in 8 sessions each session 90 minutes, once in a week. One month after the end of training sessions, questionnaires will be distributed simultaneously in intervention group and control group. During the training period of intervention group, control group will receive routine training like all centers. Participants in the intervention group would imagine that the other group will be trained after ending their sessions due to lack of space, so that "training sessions" cause no orientation in completing the second phase questionnaire

Participants/Inclusion and exclusion criteria

Inclusion criteria included mothers with at least one child with attention-deficit hyperactive disorder and no previous history of presence in emotional regulation sessions and not using psychiatric medications. Exclusion criteria included mothers had stress during last 6 months.

Intervention groups

Desired intervention in this study is training the emotional regulation to mothers with overactive children. Control group, if interested, will receive 8 training sessions after completing the second point questionnaire

Main outcome variables

Relationship between mothers with hyperactive children

Scientific title

The effect of emotional regulation training on the relationship between mothers and attention-deficit hyperactivity disorder

Public title

The effect of emotion regulation on the relationship mothers with attention-deficit hyperactivity disorder

Purpose

Education/Guidance

Inclusion/Exclusion criteria**Inclusion criteria:**

Having at least one child with attention deficit/hyperactivity disorder Not having history of attending emotional regulation therapy sessions Not to participate in the same interventions simultaneously not to use psychosocial drugs in mothers Not having a new stressor in mothers during the last 6 months Not to use drugs by mother

Exclusion criteria:

Mental illness in the mother

Age

No age limit

Gender

Both

Phase

N/A

Groups that have been masked

- Participant

Sample size

Target sample size: **80**

Randomization (investigator's opinion)

Randomized

Randomization description

Samples were selected by simple random sampling method and based on the criteria for entering the study, and then, according of participants list, random numbers are assigned to each participant, then a sortition is drawn between the numbers and each number allocated to intervention or control groups

Blinding (investigator's opinion)

Single blinded

Blinding description

The participants will not know that they are member of intervention group or control group of study

Placebo

Not used

Health conditions studied**1****Description of health condition studied**

relationship between mother and attention-deficit hyperactivity disorder

ICD-10 code**ICD-10 code description****Primary outcomes****1****Description**

The relationship between mothers and attention- deficit hyperactivity disorder in the mother-child relationship evaluation

Timepoint

At the beginning of the study and one month after the training

Method of measurement

Mother-Child Relationship Evaluation

Secondary outcomes

empty

Intervention groups**1****Description**

Intervention group: In this group, the samples will complete the mother-child relationship questionnaire first. Then they will be trained emotion regulation, in 8 sessions each session 90 minutes, once in a week. Then, one month after the last session, they will complete the mother-child relationship questionnaire again. At the end, each sample will receive a emotion regulation training booklet prepared by researcher

Behavior

2

Description

Control group: At first, samples completed the mother-child relationship questionnaire, but they will not receive any training. One month after completing emotional regulation training in the intervention group, the samples in the control group concurrently with the intervention group will again complete the mother-child relationship questionnaire and will receive the emotional regulation training if they wish

Title and more details about the data/document

Total data of participants in the study after un identifying individuals will be shared. Study protocol, statistical analysis map and clinical study report will be fully shared

When the data will become available and for how long

beginning of access period to data will be 6 months after the results are printed

To whom data/document is available

Data and other study documents can be sent to all who are interested in this field

Under which criteria data/document could be used

Data will be provided to anyone who needs information in this area or to conduct similar research in this area, without any special conditions

From where data/document is obtainable

Applicants can contact e-mail at zohreharabi96@yahoo.com for gaining information

What processes are involved for a request to access data/document

Information will be sent to the applicant immediately after request by e-mai
