The Role of Amniotic Membrane Transplantation in Ocular Chemical Burns

Protocol summary

Summary

The study will be conducted on 90 patients with grade II-IV acute ocular chemical burns (Roper - Hall classification) in the first 2 weeks of injury to evaluate the role of amniotic membrane transplantation in ocular chemical burns. After topical anesthesia, all patients initially will receive first aid therapy; which included irrigation with normal saline to normalize ocular surface PH and removal of early particulate maeuil and debris. After complete examination and obtaining informed consent, the patients will be randomized using a treatment assignment list to either amniotic membrane transplantation with conventional medical therapy (group A) or medical treatment only (group B). In the patients with bilateral injuries the eyes will be randomized separately. Amniotic membrane transplantation will be performed within 24h of presentation. The patients will be examined at days 1, 3, 7, 10, 14, 21, 28 and then biweekly until 3 months and monthly until (1 year in every visit), visual acuity will be checked (by sneillen charts).

Scientific title

The Role of Amniotic Membrane Transplantation in Ocular Chemical Burns

Public title

The Role of Amniotic Membrane Transplantation in Ocular Chemical Burns

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion Criteria: Patients with chemical eye burn grade 2-4, Burning has been occurred during 2 weeks ago.
Exclusion Criteria: Grade I burnings, Follow up of the patients has been disconnected in 6 month.

Age

No age limit

Gender

Both

Phase

N/A

Groups that have been masked
No information

Sample size
Target sample size: 90

Randomization (investigator's opinion)
