Comparative study of improvement quality of life before and after lactulose and probiotic in cirrhotic patient

Protocol summary

Study aim

The aim of this study was to evaluate the effects of lactulose and probiotics on the quality of life in cirrhotic patients.

Design

The present study is a clinical trial of phase 3, randomized, double-blind, and parallel, which will be performed on 80 patients with cirrhosis. Patients are randomly divided into two groups.

Settings and conduct

The Quality of Life Questionnaire for Chronic Hepatic Patients (CLDQ), which is based on the patient's symptoms and feelings from 1 to 7, as well as demographic information, will be obtained from the patients. this study will be conducted in the gastroenterology clinic, imam hospital, Ahvaz. Patients are randomized to receive lactulose alone and probiotic lactulose in a group of 40.

Participants/Inclusion and exclusion criteria

patients with cirrhosis for any reason, age above 18.
exclusion criteria: History of other chronic diseases other than cirrhosis, History of chronic psychosomatic illness, moderate to severe encephalopathy, brain damage, active infection, active bleeding, acute renal failure, continuous use of occipital benzodiazepines, patient dissatisfaction and probiotic contraindications, such as the use of suppressive drugs or acute and severe infections.

Intervention groups

Patients with cirrhosis are randomly divided into two groups of 40 lactulose alone and probiotic plus lactulose.

Main outcome variables

Quality of life in patients with cirrhosis

Sample sizeTarget sample size: **80****Randomization (investigator's opinion)**

Randomized

Randomization descriptionRandomization in this study will be done by a simple
method. The unit of randomization is the individual.
Using a random number table, a number is considered
for each patient, respectively.**Blinding (investigator's opinion)**

Single blinded

Blinding description

In this study, only the patient should be kept blind.
